## Essentials of The Living World, 6e (Johnson) Chapter 2 The Chemistry of Life

- 1) The nucleus of an atom is composed of
- A) protons and neutrons.
- B) protons and electrons.
- C) only electrons.
- D) only protons.
- E) only neutrons.

Answer: A

Explanation: Electrons are found outside of the nucleus. Protons and neutrons are found in the

nucleus. Please see section 2.1.

Section: 02.01

Topic: Atomic Structure Bloom's: 1. Remember

Learning Outcome: 02.01.01 Describe the basic structure of an atom in terms of three

subatomic particles.

Accessibility: Keyboard Navigation

2) Atoms that have a positive or negative charge are known as

- A) magnetic.
- B) electrically neutral.
- C) ions.
- D) protons.
- E) stable.

Answer: C

Explanation: Ions have gained or lost electrons. Please see section 2.2.

Section: 02.02

Topic: Atomic Structure; Chemical Bonds

Bloom's: 1. Remember

Learning Outcome: 02.02.01 Differentiate between a cation and an anion.

- 3) The chemical behavior of an atom is determined by its
- A) protons.
- B) neutrons.
- C) nuclei.
- D) electrons.
- E) mass.

Explanation: Electrons govern interactions since they are the atomic particles which form the bonds. Please see section 2.1.

Section: 02.01

Topic: Atomic Structure Bloom's: 1. Remember

Learning Outcome: 02.01.02 Explain why electrons determine the chemical behavior of atoms.

Accessibility: Keyboard Navigation

- 4) In a neutral atom, the number of protons is always
- A) equal to the electrons.
- B) more than the electrons.
- C) more than the neutrons.
- D) less than the neutrons.
- E) less than the electrons.

Answer: A

Explanation: Electrical neutrality means that there must be equal numbers of electrons and

protons. Please see section 2.1.

Section: 02.01

Topic: Atomic Structure Bloom's: 2. Understand

Learning Outcome: 02.01.01 Describe the basic structure of an atom in terms of three

subatomic particles.

5) The volume of space around a nucleus where an electron is most likely to be located is called
the of that electron.
A) parameter
B) spin
C) pathway
D) orbital
E) nucleus
Answer: D
Explanation: Electron orbitals provide a path for the electrons to travel. Please see section 2.1
Section: 02.01
Topic: Atomic Structure
Bloom's: 1. Remember
Learning Outcome: 02.01.03 Explain how electrons carry energy.
Accessibility: Keyboard Navigation
6) Electrons possess energy of position, also known as energy.
A) kinetic
B) latent
C) potential
D) opposition
E) excitable
Answer: C
Explanation: Potential energy is stored in a thing which has a particular position. Please see
section 2.1.
Section: 02.01
Topic: Atomic Structure
Bloom's: 1. Remember
Learning Outcome: 02.01.03 Explain how electrons carry energy.
Accessibility: Keyboard Navigation

- 7) Most elements in nature exist as mixtures of
- A) unreactive atoms.
- B) different isotopes.
- C) gases.
- D) liquids.
- E) stable ions.

Answer: B

Explanation: For example, carbon exists in nature as a mixture of three isotopes. Please see

section 2.2. Section: 02.02

Topic: Atomic Structure Bloom's: 1. Remember

Learning Outcome: 02.02.02 Differentiate between an ion and an isotope.

Accessibility: Keyboard Navigation

- 8) Carbon-14 is
- A) an important ion used in chemical reactions.
- B) the most common form of carbon.
- C) an isotope used in dating fossils.
- D) widely used in hydrogen bonds.
- E) All of the answer choices are correct.

Answer: C

Explanation: Carbon-14 spontaneously breaks down, releasing radiation. Please see section

2.2.

Section: 02.02

Topic: Atomic Structure Bloom's: 2. Understand

Learning Outcome: 02.02.02 Differentiate between an ion and an isotope.

- 9) When an electron is transferred from one atom to another, the two atoms will then be electrically attracted to one another. This results in the formation of a(n) bond.
- A) hydrogen
- B) covalent
- C) kinetic
- D) ionic
- E) static

Explanation: Ionic bonds form between two ions that form from a loss or gain of electrons.

Please see section 2.3.

Section: 02.03

Topic: Chemical Bonds Bloom's: 1. Remember

Learning Outcome: 02.03.01 Define a chemical bond, and describe the three principal kinds.

Accessibility: Keyboard Navigation

- 10) What type of bond forms between two atoms sharing electrons?
- A) hydrogen
- B) covalent
- C) kinetic
- D) ionic
- E) static

Answer: B

Explanation: Covalent bonds involve shared electrons, even if not all atoms share equally.

Please see section 2.3.

Section: 02.03

Topic: Chemical Bonds Bloom's: 1. Remember

Learning Outcome: 02.03.03 Distinguish between polar and nonpolar covalent bonds.

11) Water molecular bond to each other via hydrogen bonds. These bonds form between the slight negative charge of, and the slight positive charge of, on adjacent water molecules.  A) oxygen; hydrogen  B) hydrogen; carbon  C) hydrogen; oxygen  D) oxygen; carbon  E) hydrogen; nitrogen
Answer: A Explanation: Hydrogen bonds form between adjacent water molecules via the slight negative charge of oxygen and the slight positive charge of hydrogen. Review section 2.3. Section: 02.03 Topic: Properties of Water Bloom's: 2. Understand Learning Outcome: 02.03.04 Predict which molecules will form hydrogen bonds with each other. Accessibility: Keyboard Navigation
12) A solution with a pH of 4 has times the concentration of H <sup>+</sup> present compared to a solution with a pH of 5.  A) 10  B) 100  C) 2  D) 1,000  E) 200
Answer: A Explanation: pH units are logarithmic. A difference of one pH unit means a tenfold concentration difference. Please see section 2.5. Section: 02.05 Topic: Acids and Bases Bloom's: 3. Apply Learning Outcome: 02.05.01 Predict the change in hydrogen ion concentration represented by a difference of 1 on the pH scale. Accessibility: Keyboard Navigation

- 13) The mass number of an atom is the number of
- A) neutrons only.
- B) electrons plus the number of protons.
- C) protons only.
- D) protons plus the number of neutrons.
- E) electrons, plus the number of neutrons, plus the number of protons.

Explanation: Atomic number is the number of large particles in the nucleus of an atom of an element. Please see section 2.1.

Section: 02.01

Topic: Atomic Structure Bloom's: 1. Remember

Learning Outcome: 02.01.01 Describe the basic structure of an atom in terms of three

subatomic particles.

Accessibility: Keyboard Navigation

- 14) The atomic number of an atom is the number of
- A) neutrons only.
- B) electrons plus the number of protons.
- C) protons only.
- D) protons plus the number of neutrons.
- E) electrons, plus the number of neutrons, plus the number of protons.

Answer: C

Explanation: Atomic number is never more than mass number. Please see section 2.1.

Section: 02.01

Topic: Atomic Structure Bloom's: 1. Remember

Learning Outcome: 02.01.01 Describe the basic structure of an atom in terms of three

subatomic particles.

15) The first shell in any atom contains one orbital which may contain as many as A) 2 electrons. B) 8 protons. C) 8 electrons. D) 4 neutrons. E) 2 neutrons. Answer: A Explanation: The possible number of electrons per atom is determined by the number of protons, and the number per shell is determined by how far it is from the nucleus. Please see section 2.1. Section: 02.01 Topic: Atomic Structure Bloom's: 1. Remember Learning Outcome: 02.01.03 Explain how electrons carry energy. Accessibility: Keyboard Navigation 16) The second shell in an atom contains orbitals and holds up to electrons. A) 4; 4 B) 3; 2 C) 4; 8 D) 3; 8 E) 8; 24

Answer: C

Explanation: The second shell has four orbitals that hold two electrons each. Please see section

2.1.

Section: 02.01

Topic: Atomic Structure Bloom's: 2. Understand

Learning Outcome: 02.01.03 Explain how electrons carry energy.

- 17) If an element has an atomic number of 6 and a mass number of 14, how many neutrons does it have?
- A) 6
- B) 14
- C) 7
- D) 8
- E) 28

Explanation: The difference between mass number and atomic number is the number of

neutrons. Please see sections 2.1 and 2.2.

Section: 02.01; 02.02 Topic: Atomic Structure Bloom's: 2. Understand

Learning Outcome: 02.01.01 Describe the basic structure of an atom in terms of three

subatomic particles.; 02.02.02 Differentiate between an ion and an isotope.

Accessibility: Keyboard Navigation

- 18) If you were grading an exam about water, which statement would lose points?
- A) Hydrogens have partial negative charges.
- B) Water is a polar molecule.
- C) Covalent bonds exist within a water molecule.
- D) Hydrogen bonds exist between water molecules.
- E) Hydrogen bonds are relatively weak bonds.

Answer: A

Explanation: Hydrogen atoms in water molecules have partial positive charges. Please see

section 2.3. Section: 02.03

Topic: Properties of Water

Bloom's: 3. Apply

Learning Outcome: 02.03.03 Distinguish between polar and nonpolar covalent bonds.;

02.03.04 Predict which molecules will form hydrogen bonds with each other.

- 19) Which type of chemical substance lowers the H<sup>+</sup> concentration in a solution?
- A) ice
- B) acid
- C) base
- D) buffer
- E) hydrogen ion

Answer: C

Explanation: A base will accept free H<sup>+</sup> in a solution and thereby raising the pH. Please see

section 2.5. Section: 02.05

Topic: Acids and Bases Bloom's: 2. Understand

Learning Outcome: 02.05.01 Predict the change in hydrogen ion concentration represented by

a difference of 1 on the pH scale. Accessibility: Keyboard Navigation

- 20) Water moving up into a paper towel, a polar substance, is attributable to
- A) heat storage.
- B) high heat of vaporization.
- C) electronegativity.
- D) cohesion.
- E) adhesion.

Answer: E

Explanation: Adhesion is the property of water sticking to other polar substances. Please see

section 2.4. Section: 02.04

Topic: Properties of Water Bloom's: 2. Understand

Learning Outcome: 02.04.04 Distinguish cohesion from adhesion.

- 21) If you wanted to stop an insect from walking on water, you would need to add something to the water to stop
- A) high heat of vaporization.
- B) cohesion.
- C) adhesion.
- D) polar covalent bonds.
- E) heat storage.

Answer: B

Explanation: Cohesion is due to water molecules sticking together as a result of hydrogen

bonding. Please see section 2.4.

Section: 02.04

Topic: Properties of Water

Bloom's: 3. Apply

Learning Outcome: 02.04.04 Distinguish cohesion from adhesion.

Accessibility: Keyboard Navigation

22) Buffers always release H<sup>+</sup> ions into solution to stabilize pH.

Answer: FALSE

Explanation: Buffers act to minimize changes in pH, which sometimes involves releasing hydrogen ions into solution but other times involves taking up hydrogen ions from the solution.

Please see section 2.5.

Section: 02.05

Topic: Acids and Bases Bloom's: 2. Understand

Learning Outcome: 02.05.01 Predict the change in hydrogen ion concentration represented by

a difference of 1 on the pH scale. Accessibility: Keyboard Navigation

23) Nonpolar molecules, such as fats, are water-soluble.

Answer: FALSE

Explanation: Nonpolar molecules are hydrophobic, or "water fearing." Please see section 2.4.

Section: 02.04

Topic: Properties of Water Bloom's: 1. Remember

Learning Outcome: 02.04.05 Explain why oil will not dissolve in water.

24) The number of protons in the nucleus of an atom is called the
Answer: atomic number Explanation: Atomic number is always the same as or less than atomic mass. Please see section 2.1. Section: 02.01
Topic: Atomic Structure
Bloom's: 1. Remember
Learning Outcome: 02.01.01 Describe the basic structure of an atom in terms of three subatomic particles.
Accessibility: Keyboard Navigation
25) If you wanted to change the mass number of an atom, you would have to alter either the number of protons or the number of
Answer: neutrons  Explanation: Mass number is the sum of the numbers of protons and neutrons in an atomic nucleus. Please see section 2.1.  Section: 02.01  Topic: Atomic Structure  Bloom's: 3. Apply
Learning Outcome: 02.01.01 Describe the basic structure of an atom in terms of three subatomic particles.  Accessibility: Keyboard Navigation
26) If you were helping a professor with an experiment in which different forms of carbon were to be used, you would go to the chemical cabinet to find different
Answer: isotopes Explanation: Carbon occurs in nature in three isotopes, which are forms of carbon differing in weight but not in how they form bonds. Please see section 2.2. Section: 02.02
Topic: Atomic Structure Bloom's: 2. Understand Learning Outcome: 02.02.02 Differentiate between an ion and an isotope. Accessibility: Keyboard Navigation

27) When water ionizes, the negatively charged OH fragment is the ion.
Answer: hydroxide Explanation: Besides hydroxide, water produces a proton for the other ion when it ionizes. Please see section 2.5. Section: 02.05 Topic: Properties of Water; Acids and Bases Bloom's: 1. Remember
Learning Outcome: 02.05.01 Predict the change in hydrogen ion concentration represented by a difference of 1 on the pH scale.  Accessibility: Keyboard Navigation
28) We use the scale to measure concentrations of hydrogen ions in a solution.
Answer: pH Explanation: pH ranges from strongly acidic to strongly basic. Please see section 2.5. Section: 02.05 Topic: Acids and Bases Bloom's: 1. Remember Learning Outcome: 02.05.01 Predict the change in hydrogen ion concentration represented by a difference of 1 on the pH scale. Accessibility: Keyboard Navigation
29) A solution with a pH of 3 is said to be highly
Answer: acidic Explanation: Examples of acids include lemon juice and stomach acid. Please see section 2.5. Section: 02.05 Topic: Acids and Bases Bloom's: 2. Understand Learning Outcome: 02.05.01 Predict the change in hydrogen ion concentration represented by a difference of 1 on the pH scale. Accessibility: Keyboard Navigation
30) The chemical bond within a water molecule is a bond.
Answer: covalent Explanation: Atoms within a water molecule share electrons, so the bonds formed are covalent. Please see section 2.3. Section: 02.03
Topic: Chemical Bonds; Properties of Water Bloom's: 1. Remember Learning Outcome: 02.03.03 Distinguish between polar and nonpolar covalent bonds. Accessibility: Keyboard Navigation

31) Due to \_\_\_\_\_ bonding, ice is less dense than water.

Answer: hydrogen

Explanation: Fish in cold lakes are saved in the winter by the lower density of water ice since

water ice then floats, rather than sinking and crushing the fish. Please see section 2.4.

Section: 02.04

Topic: Properties of Water Bloom's: 2. Understand

Learning Outcome: 02.04.02 Explain why ice floats.

Accessibility: Keyboard Navigation

32) A substance that increases the concentration of H<sup>+</sup> is a(n) \_\_\_\_\_.

Answer: acid

Explanation: Acids release protons, lowering pH. Please see section 2.5.

Section: 02.05

Topic: Properties of Water; Acids and Bases

Bloom's: 2. Understand

Learning Outcome: 02.05.01 Predict the change in hydrogen ion concentration represented by

a difference of 1 on the pH scale. Accessibility: Keyboard Navigation

33) While exercising you begin to sweat. Sweating is cooling your body because it takes energy with it in the form of heat.

Answer: TRUE

Explanation: The hydrogen bonds in water are what makes it effective in cooling organisms as they sweat. Please see section 2.4.

Section: 02.04

Topic: Properties of Water

Bloom's: 4. Analyze

Learning Outcome: 02.04.03 Explain why sweating cools you.

Accessibility: Keyboard Navigation

34) Two hydrophobic molecules in a cell membrane would form a hydrogen bond.

Answer: FALSE

Explanation: Hydrophobic molecules cannot form hydrogen bonds since they lack polar atoms.

Please see section 2.3.

Section: 02.03

Topic: Chemical Bonds Bloom's: 4. Analyze

Learning Outcome: 02.03.04 Predict which molecules will form hydrogen bonds with each

other.

35) You are chemically analyzing a new compound. It does not dissolve in water. You characterize it as being hydrophilic.

Answer: FALSE

Explanation: Chemicals that do not dissolve in water are hydrophobic. Please see section 2.4.

Section: 02.04

Topic: Properties of Water

Bloom's: 3. Apply

Learning Outcome: 02.04.05 Explain why oil will not dissolve in water.

Accessibility: Keyboard Navigation

- 36) Doctors prescribe medicines to help the symptoms of acid reflux which cause burning in the esophagus from excess acid in the stomach. To help neutralize the acid, medicines are used to
- A) accept excess H<sup>+</sup>.
- B) accept excess OH-.
- C) donate excess H<sup>+</sup>.
- D) donate excess OH<sup>-</sup>.
- E) donate either OH- or H<sup>+</sup>.

Answer: A

Explanation: Antacids work by accepting excess hydrogen ions to raise the pH. Please see

section 2.5. Section: 02.05

Topic: Acids and Bases

Bloom's: 3. Apply

Learning Outcome: 02.05.01 Predict the change in hydrogen ion concentration represented by

a difference of 1 on the pH scale. Accessibility: Keyboard Navigation

- 37) In an ionic bond, a cation is an atom that has \_\_\_\_\_ and is now positively charged.
- A) lost an electron
- B) gained an electron
- C) lost a neutron
- D) gained a neutron
- E) gained a proton

Answer: A

Explanation: Cations have lost electrons to anions. Please see section 2.2.

Section: 02.02

Topic: Chemical Bonds Bloom's: 2. Understand

Learning Outcome: 02.02.01 Differentiate between a cation and an anion.

38) Covalent bonds between water molecules require a high amount of energy to break which is why water heats slowly.

Answer: FALSE

Explanation: Hydrogen bonds are found between water molecules. Please see section 2.4.

Section: 02.04

Topic: Properties of Water Bloom's: 2. Understand

Learning Outcome: 02.04.01 Explain why water heats up so slowly.

Accessibility: Keyboard Navigation

39) Ionic bond of salt molecules form between negative sodium molecules and positive chlorine atoms resulting in a crystal formation.

Answer: FALSE

Explanation: Sodium loses electrons and chlorine gains electrons. This exchange results in

ionic bond formation. Please see section 2.3.

Section: 02.03

Topic: Chemical Bonds Bloom's: 2. Understand

Learning Outcome: 02.03.02 Explain how ionic bonds promote crystal formation.
