

Natural Disasters, 11e (Abbott)

Chapter 2 Internal Energy and Plate Tectonics

1) Earth is about _____ years old.

- A) 30,000 thousand
- B) 50 million
- C) 3,500 million
- D) 13.5 billion
- E) 4.5 billion

Answer: E

Section: Internal Sources of Energy

Topic: Internal Sources of Energy

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

2) The heat that transformed Earth early in its history came primarily from all but which of the following?

- A) impact energy
- B) gravitational energy
- C) dark energy
- D) the decay of radioactive elements

Answer: C

Section: Internal Sources of Energy

Topic: Internal Sources of Energy

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

3) The early differentiation of Earth into a mantle and a core was created by _____.

- A) gravitational accretion of iron-rich particles in the core, followed by silicate-rich particles in the mantle
- B) nuclear fission in the center of Earth, which converted hydrogen and helium to iron
- C) the buildup of heat and the melting of iron, which was pulled by gravity to the center of Earth
- D) the magnetic attraction between cations and anions of iron and nickel

Answer: C

Section: Earth History

Topic: Earth History

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

4) Earth's inner core is a 2,450-km diameter _____ mass with temperatures up to 4,300°C (7,770°F).

- A) gaseous
- B) liquid
- C) solid
- D) plasma-like

Answer: C

Section: Internal Sources of Energy

Topic: Internal Sources of Energy

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

5) As radioactive atoms decay, heat energy is _____.

- A) absorbed
- B) released
- C) neither absorbed nor released
- D) may be absorbed or released, depending on which isotope is involved

Answer: B

Section: Internal Sources of Energy

Topic: Internal Sources of Energy

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

6) All of the continents were once combined into a single supercontinent called _____.

- A) Laurasia
- B) Gondwanaland
- C) Tethys
- D) Panthalassa
- E) Pangaea

Answer: E

Section: Plate Tectonics

Topic: Plate Tectonics

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

- 7) Which of the following is *not* a basic tenet of plate tectonics?
- A) Melted asthenosphere flows upward as magma and cools to form new ocean floor lithosphere.
 - B) The new lithosphere slowly moves laterally away from the zones of oceanic crust formation on top of the underlying asthenosphere (seafloor spreading).
 - C) When the leading edge of a moving slab of oceanic lithosphere collides with another slab, the older, colder, denser slab turns downward and is pulled by gravity back into the asthenosphere (subduction), while the less-dense, more buoyant slab overrides it.
 - D) The slab pulled into the asthenosphere begins the process of melting and moves into the liquid core.
 - E) The slab pulled into the asthenosphere begins the process of reabsorption into the mantle.

Answer: D

Section: Plate Tectonics

Topic: Plate Tectonics

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

- 8) The time needed for a typical atom in an oceanic plate to complete a plate-tectonic cycle is _____ years.
- A) about a hundred thousand
 - B) about a million
 - C) about 10 million
 - D) in excess of 250 million
 - E) less than 500

Answer: D

Section: Plate Tectonics

Topic: Plate Tectonics

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

- 9) The most famous and outspoken of the early proponents of continental drift was _____.
- A) Plato
 - B) Leonardo da Vinci
 - C) William Smith
 - D) Alfred Wegener
 - E) Immanuel Kant

Answer: D

Section: Plate Tectonics

Topic: Plate Tectonics

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

10) In the _____, evidence abounded, mechanisms seemed plausible, and the plate-tectonic theory was developed and widely accepted.

- A) mid-1880s
- B) mid-1920s
- C) mid-1940s
- D) mid-1960s
- E) mid-1980s

Answer: D

Section: Plate Tectonics

Chapter: 02

11) After lava cools below the Curie point, which is about _____, atoms in iron-bearing minerals become magnetized in the direction of Earth's magnetic field at that time and place.

- A) 50°C
- B) 250°C
- C) 550°C
- D) 850°C
- E) 1,150°C

Answer: C

Section: Plate Tectonics

Topic: Plate Tectonics

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

12) After lava cools below the _____ point atoms in iron-bearing minerals become magnetized in the direction of Earth's magnetic field at that time and place.

- A) Maxwell
- B) critical
- C) triple
- D) Curie
- E) solidus

Answer: D

Section: Plate Tectonics

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

13) If sea floor spreading occurs at a constant rate, the widths of magnetized seafloor strips have _____ ratios as the lengths of time between successive reversals of Earth's magnetic field.

- A) opposite
- B) critical
- C) triple
- D) two to one
- E) the same

Answer: E

Chapter: 02

14) The oldest rocks on the ocean floors are about _____ years in age.

- A) 50,000
- B) 45 million
- C) 200 million
- D) 2 billion
- E) 4.5 billion

Answer: C

Section: Plate Tectonics

Topic: Plate Tectonics

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

15) The hot-spot-melting-through-lithosphere process forms lines of extinct volcanoes on the ocean floor, from youngest to oldest, _____.

- A) with random ages along the lines
- B) in a direction pointing toward the Sun
- C) pointing at 90 degrees to the direction of plate movement
- D) pointing in the opposite direction of plate movement
- E) pointing in the direction of plate movement

Answer: E

Section: Plate Tectonics

Topic: Plate Tectonics

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

16) The blanket of sediment on the sea floor is _____ toward the ocean margins.

- A) very thin at the volcanic ridges and thickens
- B) very thick at the volcanic ridges and thins
- C) thick at the volcanic ridges and thickens more
- D) very thin at the volcanic ridges and is missing

Answer: A

Section: Plate Tectonics

Topic: Plate Tectonics

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

17) Moving progressively away from the ridges, the ocean water depths increase systematically with seafloor age due to all but which of the following?

- A) Cooling and contraction of the oceanic crust with a resultant increase in density
- B) Isostatic down warping due to the weight of sediments deposited on the sea floor
- C) Erosion of the older ocean floor by deep ocean currents
- D) Conduction of heat away from warm surface rocks

Answer: C

Section: Plate Tectonics

Topic: Plate Tectonics

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

18) When oceanic lithosphere collides with another plate, the _____ in the process of subduction.

- A) older, colder plate turns downward beneath the younger, warmer plate
- B) younger, warmer plate turns downward beneath the older, colder plate
- C) plates both disappear downward
- D) plates pile up, forming mid-ocean ridges

Answer: A

Topic: The Grand Unifying Theory

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

- 19) The principle of uniformitarianism, developed by James Hutton, implies that _____.
A) gravity results from the bending of space and time
B) the present provides almost no clues to understanding the past
C) geologic processes always occur at the same rate
D) natural laws are uniform through time and space
E) all hot spots formed early in Earth's history

Answer: D

Chapter: 02

- 20) Which of the following accurately describes the state of the continents and ocean 65 million years ago?
A) Seafloor spreading had opened and connected the North and South Atlantic Ocean but North America and Eurasia were still partially connected.
B) All the major continents adjoined in a landmass called Pangaea and surrounded by the Tethys Sea.
C) The Iapetus Ocean was in the final stages of closing before the initial formation of Pangaea.
D) All the continents were roughly in the relative positions they hold today but were much closer together with smaller oceans in-between them.

Answer: A

Chapter: 02

- 21) Choose the most likely outcome if the large ice sheet on Greenland was to completely melt.
A) Greenland would slowly rise over thousands of years as isostatic rebound occurs.
B) Greenland would slowly sink over thousands of years due to an isostatic adjustment.
C) Greenland would rise hundreds of meters in just a few years as isostatic rebound occurs.
D) Greenland would sink by hundreds of meters in just a few years due to an isostatic adjustment.

Answer: A

Chapter: 02

23) Our solar system formed _____.

- A) as the Sun's gravity trapped planets from other solar systems as it passed by them
- B) during the Big Bang as matter started to form as the temperature of the universe cooled
- C) through collisions of matter within a rotating cloud of gas, ice, dust, and other solid debris
- D) when the Milky Way's black hole expelled Hawking radiation to our current location
- E) just after the Big Bang when two short-lived solar systems collided

Answer: C

Section: Origin of the Sun and Planets

Topic: Origin of the Sun and Planets

Bloom's: 1. Remember

Accessibility: Keyboard Navigation

Chapter: 02

24) Which statement accurately describes the planets of our solar system?

- A) The four inner planets are smaller and rocky and the four outer planets are giant icy bodies composed mostly of hydrogen and helium.
- B) The planets get progressively larger and rockier with increasing distance from the Sun.
- C) The planets get progressively smaller and less rocky with increasing distance from the Sun.
- D) The three inner planets are smaller planets composed of hydrogen and helium and the five outer planets are larger, mostly solid, and composed of iron and nickel.

Answer: A

Chapter: 02

- 25) The solar radiation we receive on Earth is the result of _____.
- A) the nuclear fusion of iron into hydrogen
 - B) the nuclear fusion of hydrogen into helium
 - C) nuclear fission as helium is split into hydrogen
 - D) nuclear fission as carbon is split into any number of smaller atoms
 - E) the oxidation of combustible material within the Sun's core

Answer: B

Accessibility: Keyboard Navigation

Chapter: 02

- 26) The Moon is thought to have formed _____.
- A) from material ejected during the t-tauri phase of the Sun's early history
 - B) when an early massive supervolcano ejected materials into orbit around Earth
 - C) after the impact of two comets somewhere between Earth and Venus
 - D) after the impact of two protoplanets somewhere between Earth and Mars
 - E) from material that coalesced after an impact between Earth and a Mars-sized object

Answer: E

Chapter: 02

30) An isotope's half-life is equal to the time it takes _____.

- A) nuclear fission to begin once the isotope first forms
- B) a one gram mass of parent atoms to disintegrate into one gram mass of daughter atoms
- C) half of the electrons in its outer most shell to be covalently bonded with oxygen
- D) half of the neutrons to be converted into protons
- E) half of the parent atoms to decay into daughter atoms

Answer: E
