17. False; define f(x) = x for  $x \neq a$  and f(a) = a + 1. Then  $\lim_{x \to a} f(x) = a \neq f(a) = a + 1$ .

**18.** True; by 1.1.3.

19. False; define f(x) = 0 for x < 0 and f(x) = x + 1 for  $x \ge 0$ . Then the left and right limits exist but are unequal.

**20.** False; define f(x) = 1/x for x > 0 and f(0) = 2.

**27.**  $m_{\text{sec}} = \frac{x^2 - 1}{x + 1} = x - 1$  which gets close to -2 as x gets close to -1, thus y - 1 = -2(x + 1) or y = -2x - 1.

**28.**  $m_{\text{sec}} = \frac{x^2}{x} = x$  which gets close to 0 as x gets close to 0, thus y = 0.

**29.**  $m_{\text{sec}} = \frac{x^4 - 1}{x - 1} = x^3 + x^2 + x + 1$  which gets close to 4 as x gets close to 1, thus y - 1 = 4(x - 1) or y = 4x - 3.

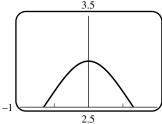

**30.**  $m_{\text{sec}} = \frac{x^4 - 1}{x + 1} = x^3 - x^2 + x - 1$  which gets close to -4 as x gets close to -1, thus y - 1 = -4(x + 1) or y = -4x - 3.

31. (a) The length of the rod while at rest.

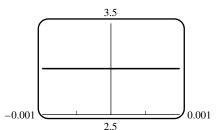

(b) The limit is zero. The length of the rod approaches zero as its speed approaches c.

**32.** (a) The mass of the object while at rest.

(b) The limiting mass as the velocity approaches the speed of light; the mass is unbounded.

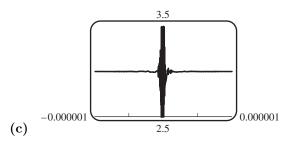

33. (a) 2.5 The limit appears to be 3.

(b)

The limit appears to be 3.

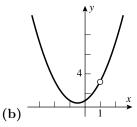

The limit does not exist.

## Exercise Set 1.2

- **1.** (a) By Theorem 1.2.2, this limit is  $2 + 2 \cdot (-4) = -6$ .
  - (b) By Theorem 1.2.2, this limit is  $0 3 \cdot (-4) + 1 = 13$ .
  - (c) By Theorem 1.2.2, this limit is  $2 \cdot (-4) = -8$ .
  - (d) By Theorem 1.2.2, this limit is  $(-4)^2 = 16$ .
  - (e) By Theorem 1.2.2, this limit is  $\sqrt[3]{6+2} = 2$ .
  - (f) By Theorem 1.2.2, this limit is  $\frac{2}{(-4)} = -\frac{1}{2}$ .
- **2.** (a) By Theorem 1.2.2, this limit is 0 + 0 = 0.
  - (b) The limit doesn't exist because  $\lim f$  doesn't exist and  $\lim g$  does.
  - (c) By Theorem 1.2.2, this limit is -2 + 2 = 0.
  - (d) By Theorem 1.2.2, this limit is 1 + 2 = 3.
  - (e) By Theorem 1.2.2, this limit is 0/(1+0) = 0.
  - (f) The limit doesn't exist because the denominator tends to zero but the numerator doesn't.
  - (g) The limit doesn't exist because  $\sqrt{f(x)}$  is not defined for 0 < x < 2.
  - (h) By Theorem 1.2.2, this limit is  $\sqrt{1} = 1$ .
- **3.** By Theorem 1.2.3, this limit is  $2 \cdot 1 \cdot 3 = 6$ .
- **4.** By Theorem 1.2.3, this limit is  $3^3 3 \cdot 3^2 + 9 \cdot 3 = 27$ .
- **5.** By Theorem 1.2.4, this limit is  $(3^2 2 \cdot 3)/(3 + 1) = 3/4$ .
- **6.** By Theorem 1.2.4, this limit is  $(6 \cdot 0 9)/(0^3 12 \cdot 0 + 3) = -3$ .
- 7. After simplification,  $\frac{x^4 1}{x 1} = x^3 + x^2 + x + 1$ , and the limit is  $1^3 + 1^2 + 1 + 1 = 4$ .
- 8. After simplification,  $\frac{t^3+8}{t+2} = t^2 2t + 4$ , and the limit is  $(-2)^2 2 \cdot (-2) + 4 = 12$ .
- **9.** After simplification,  $\frac{x^2 + 6x + 5}{x^2 3x 4} = \frac{x + 5}{x 4}$ , and the limit is (-1 + 5)/(-1 4) = -4/5.

- **10.** After simplification,  $\frac{x^2 4x + 4}{x^2 + x 6} = \frac{x 2}{x + 3}$ , and the limit is (2 2)/(2 + 3) = 0.
- 11. After simplification,  $\frac{2x^2+x-1}{x+1}=2x-1$ , and the limit is  $2\cdot(-1)-1=-3$ .
- **12.** After simplification,  $\frac{3x^2 x 2}{2x^2 + x 3} = \frac{3x + 2}{2x + 3}$ , and the limit is  $(3 \cdot 1 + 2)/(2 \cdot 1 + 3) = 1$ .
- 13. After simplification,  $\frac{t^3 + 3t^2 12t + 4}{t^3 4t} = \frac{t^2 + 5t 2}{t^2 + 2t}$ , and the limit is  $(2^2 + 5 \cdot 2 2)/(2^2 + 2 \cdot 2) = 3/2$ .
- **14.** After simplification,  $\frac{t^3 + t^2 5t + 3}{t^3 3t + 2} = \frac{t + 3}{t + 2}$ , and the limit is (1 + 3)/(1 + 2) = 4/3.
- **15.** The limit is  $+\infty$ .
- **16.** The limit is  $-\infty$ .
- 17. The limit does not exist.
- **18.** The limit is  $+\infty$ .
- **19.** The limit is  $-\infty$ .
- **20.** The limit does not exist.
- **21.** The limit is  $+\infty$ .
- **22.** The limit is  $-\infty$ .
- 23. The limit does not exist.
- **24.** The limit is  $-\infty$ .
- **25.** The limit is  $+\infty$ .
- **26.** The limit does not exist.
- **27.** The limit is  $+\infty$ .
- **28.** The limit is  $+\infty$ .
- **29.** After simplification,  $\frac{x-9}{\sqrt{x}-3} = \sqrt{x}+3$ , and the limit is  $\sqrt{9}+3=6$ .
- **30.** After simplification,  $\frac{4-y}{2-\sqrt{y}}=2+\sqrt{y}$ , and the limit is  $2+\sqrt{4}=4$ .
- **31.** (a) 2 (b) 2 (c) 2
- **32.** (a) does not exist (b) 1 (c) 4
- **33.** True, by Theorem 1.2.2.
- **34.** False; e.g.  $\lim_{x\to 0} \frac{x^2}{x} = 0$ .

- **35.** False; e.g. f(x) = 2x, g(x) = x, so  $\lim_{x \to 0} f(x) = \lim_{x \to 0} g(x) = 0$ , but  $\lim_{x \to 0} f(x)/g(x) = 2$ .
- **36.** True, by Theorem 1.2.4.
- **37.** After simplification,  $\frac{\sqrt{x+4}-2}{x} = \frac{1}{\sqrt{x+4}+2}$ , and the limit is 1/4.
- **38.** After simplification,  $\frac{\sqrt{x^2+4}-2}{x} = \frac{x}{\sqrt{x^2+4}+2}$ , and the limit is 0.
- **39.** (a) After simplification,  $\frac{x^3-1}{x-1}=x^2+x+1$ , and the limit is 3.

- **40.** (a) After simplification,  $\frac{x^2-9}{x+3}=x-3$ , and the limit is -6, so we need that k=-6.
  - (b) On its domain (all real numbers), f(x) = x 3.
- 41. (a) Theorem 1.2.2 doesn't apply; moreover one cannot subtract infinities.
  - **(b)**  $\lim_{x \to 0^+} \left( \frac{1}{x} \frac{1}{x^2} \right) = \lim_{x \to 0^+} \left( \frac{x 1}{x^2} \right) = -\infty.$
- **42.** (a) Theorem 1.2.2 assumes that  $L_1$  and  $L_2$  are real numbers, not infinities. It is in general not true that " $\infty \cdot 0 = 0$ ".
  - **(b)**  $\frac{1}{x} \frac{2}{x^2 + 2x} = \frac{x^2}{x(x^2 + 2x)} = \frac{1}{x+2}$  for  $x \neq 0$ , so that  $\lim_{x \to 0} \left( \frac{1}{x} \frac{2}{x^2 + 2x} \right) = \frac{1}{2}$ .
- **43.** For  $x \neq 1$ ,  $\frac{1}{x-1} \frac{a}{x^2-1} = \frac{x+1-a}{x^2-1}$  and for this to have a limit it is necessary that  $\lim_{x \to 1} (x+1-a) = 0$ , i.e. a = 2. For this value,  $\frac{1}{x-1} \frac{2}{x^2-1} = \frac{x+1-2}{x^2-1} = \frac{x-1}{x^2-1} = \frac{1}{x+1}$  and  $\lim_{x \to 1} \frac{1}{x+1} = \frac{1}{2}$ .
- **44.** (a) For small x,  $1/x^2$  is much bigger than  $\pm 1/x$ .
  - (b)  $\frac{1}{x} + \frac{1}{x^2} = \frac{x+1}{x^2}$ . Since the numerator has limit 1 and  $x^2$  tends to zero from the right, the limit is  $+\infty$ .
- **45.** The left and/or right limits could be plus or minus infinity; or the limit could exist, or equal any preassigned real number. For example, let  $q(x) = x x_0$  and let  $p(x) = a(x x_0)^n$  where n takes on the values 0, 1, 2.
- **46.** If on the contrary  $\lim_{x\to a} g(x)$  did exist then by Theorem 1.2.2 so would  $\lim_{x\to a} [f(x)+g(x)]$ , and that would be a contradiction.
- **47.** Clearly, g(x) = [f(x) + g(x)] f(x). By Theorem 1.2.2,  $\lim_{x \to a} [f(x) + g(x)] \lim_{x \to a} f(x) = \lim_{x \to a} [f(x) + g(x)] f(x) = \lim_{x \to a} [f(x) + g(x)] = \lim_{x \to$

**(b)**  $0 - 4 \cdot (-5) + 1 = 21$  **(c)**  $3 \cdot (-5) = -15$  **(d)**  $(-5)^2 = 25$ 

(c)  $+\infty$ 

**48.** By Theorem 1.2.2,  $\lim_{x\to a} f(x) = \left(\lim_{x\to a} \frac{f(x)}{g(x)}\right) \lim_{x\to a} g(x) = \left(\lim_{x\to a} \frac{f(x)}{g(x)}\right) \cdot 0 = 0$ , since  $\lim_{x\to a} \frac{f(x)}{g(x)}$  exists.

, by the highest degree terms.

- **33.** False; if x/2 > 1000 then  $1000x < x^2/2, x^2 1000x > x^2/2$ , so the limit is  $+\infty$ .
- **34.** False; y=0 is a horizontal asymptote for the curve  $y=e^x$  yet  $\lim_{x\to +\infty}e^x$  does not exist.
- **35.** True: for example  $f(x) = \sin x/x$  crosses the x-axis infinitely many times at  $x = n\pi, n = 1, 2, \ldots$
- **36.** False: if the asymptote is y=0, then  $\lim_{x\to\pm\infty}p(x)/q(x)=0$ , and clearly the degree of p(x) is strictly less than the degree of q(x). If the asymptote is  $y=L\neq 0$ , then  $\lim_{x\to\pm\infty}p(x)/q(x)=L$  and the degrees must be equal.

- **1.** (a) |f(x) f(0)| = |x + 2 2| = |x| < 0.1 if and only if |x| < 0.1.
  - **(b)** |f(x) f(3)| = |(4x 5) 7| = 4|x 3| < 0.1 if and only if |x 3| < (0.1)/4 = 0.025.
  - (c)  $|f(x) f(4)| = |x^2 16| < \epsilon$  if  $|x 4| < \delta$ . We get  $f(x) = 16 + \epsilon = 16.001$  at x = 4.000124998, which corresponds to  $\delta = 0.000124998$ ; and  $f(x) = 16 \epsilon = 15.999$  at x = 3.999874998, for which  $\delta = 0.000125002$ . Use the smaller  $\delta$ : thus  $|f(x) 16| < \epsilon$  provided |x 4| < 0.000125 (to six decimals).
- **2.** (a) |f(x) f(0)| = |2x + 3 3| = 2|x| < 0.1 if and only if |x| < 0.05.

- **5.**  $|(x^3-4x+5)-2| < 0.05$  is equivalent to  $-0.05 < (x^3-4x+5)-2 < 0.05$ , which means  $1.95 < x^3-4x+5 < 2.05$ . Now  $x^3-4x+5 = 1.95$  at x = 1.0616, and  $x^3-4x+5 = 2.05$  at x = 0.9558. So  $\delta = \min(1.0616 1, 1 0.9558) = 0.0442$ .

**6.**  $\sqrt{5x+1} = 3.5$  at x = 2.25,  $\sqrt{5x+1} = 4.5$  at x = 3.85, so  $\delta = \min(3-2.25, 3.85-3) = 0.75$ .

- 7. With the TRACE feature of a calculator we discover that (to five decimal places) (0.87000, 1.80274) and (1.13000, 2.19301) belong to the graph. Set  $x_0 = 0.87$  and  $x_1 = 1.13$ . Since the graph of f(x) rises from left to right, we see that if  $x_0 < x < x_1$  then 1.80274 < f(x) < 2.19301, and therefore 1.8 < f(x) < 2.2. So we can take  $\delta = 0.13$ .
- 8. From a calculator plot we conjecture that  $\lim_{x\to 0} f(x) = 2$ . Using the TRACE feature we see that the points  $(\pm 0.2, 1.94709)$  belong to the graph. Thus if -0.2 < x < 0.2, then  $1.95 < f(x) \le 2$  and hence  $|f(x) L| < 0.05 < 0.1 = \epsilon$ .

- **38.** If the limit did exist, then for  $\epsilon = 1/2$  there would exist  $\delta > 0$  such that if  $|x| < \delta$  then |f(x) L| < 1/2. Some of the x-values are rational, for which |L| < 1/2; some are irrational, for which |1 L| < 1/2. But 1 = |1| = L + (1 L) < 1/2 + 1/2, or 1 < 1, a contradiction. Hence the limit cannot exist.

**63.** If M < 0 then  $-\frac{1}{x^4} < M$  when  $0 < x^4 < -\frac{1}{M}$ , or  $|x| < \frac{1}{(-M)^{1/4}}$ , so  $\delta = \frac{1}{(-M)^{1/4}}$ .

- **64.** If M > 0 then  $\frac{1}{x^4} > M$  when  $0 < x^4 < \frac{1}{M}$ , or  $x < \frac{1}{M^{1/4}}$ , so  $\delta = \frac{1}{M^{1/4}}$ .
- **65.** If x > 2 then  $|x + 1 3| = |x 2| = x 2 < \epsilon$  if  $2 < x < 2 + \epsilon$ , so  $\delta = \epsilon$ .
- **66.** If x < 1 then  $|3x + 2 5| = |3x 3| = 3|x 1| = 3(1 x) < \epsilon$  if  $1 x < \epsilon/3$ , or  $1 \epsilon/3 < x < 1$ , so  $\delta = \epsilon/3$ .
- **67.** If x > 4 then  $\sqrt{x-4} < \epsilon$  if  $x-4 < \epsilon^2$ , or  $4 < x < 4 + \epsilon^2$ , so  $\delta = \epsilon^2$ .
- **68.** If x < 0 then  $\sqrt{-x} < \epsilon$  if  $-x < \epsilon^2$ , or  $-\epsilon^2 < x < 0$ , so  $\delta = \epsilon^2$ .
- **69.** If x > 2 then  $|f(x) 2| = |x 2| = x 2 < \epsilon$  if  $2 < x < 2 + \epsilon$ , so  $\delta = \epsilon$ .
- **70.** If x < 2 then  $|f(x) 6| = |3x 6| = 3|x 2| = 3(2 x) < \epsilon$  if  $2 x < \epsilon/3$ , or  $2 \epsilon/3 < x < 2$ , so  $\delta = \epsilon/3$ .
- **71.** (a) Definition: For every M < 0 there corresponds a  $\delta > 0$  such that if  $1 < x < 1 + \delta$  then f(x) < M. In our case we want  $\frac{1}{1-x} < M$ , i.e.  $1-x > \frac{1}{M}$ , or  $x < 1 \frac{1}{M}$ , so we can choose  $\delta = -\frac{1}{M}$ .
  - (b) Definition: For every M>0 there corresponds a  $\delta>0$  such that if  $1-\delta < x < 1$  then f(x)>M. In our case we want  $\frac{1}{1-x}>M$ , i.e.  $1-x<\frac{1}{M}$ , or  $x>1-\frac{1}{M}$ , so we can choose  $\delta=\frac{1}{M}$ .
- **72.** (a) Definition: For every M > 0 there corresponds a  $\delta > 0$  such that if  $0 < x < \delta$  then f(x) > M. In our case we want  $\frac{1}{x} > M$ , i.e.  $x < \frac{1}{M}$ , so take  $\delta = \frac{1}{M}$ .

- **73.** (a) Given any M > 0, there corresponds an N > 0 such that if x > N then f(x) > M, i.e. x + 1 > M, or x > M 1, so N = M 1.
  - (b) Given any M < 0, there corresponds an N < 0 such that if x < N then f(x) < M, i.e. x + 1 < M, or x < M 1, so N = M 1.

- 11. None, this is a continuous function on the real numbers.
- 12. None, this is a continuous function on the real numbers.
- **13.** None, this is a continuous function on the real numbers.
- **14.** The function is not continuous at x = 2 and x = -2.
- **15.** The function is not continuous at x = -1/2 and x = 0.
- 16. None, this is a continuous function on the real numbers.
- 17. The function is not continuous at x = 0, x = 1 and x = -1.
- **18.** The function is not continuous at x = 0 and x = -4.
- **19.** None, this is a continuous function on the real numbers.
- **20.** The function is not continuous at x = 0 and x = -1.
- **21.** None, this is a continuous function on the real numbers. f(x) = 2x + 3 is continuous on x < 4 and  $f(x) = 7 + \frac{16}{x}$  is continuous on 4 < x;  $\lim_{x \to 4^-} f(x) = \lim_{x \to 4^+} f(x) = f(4) = 11$  so f is continuous at x = 4.
- **22.** The function is not continuous at x=1, as  $\lim_{x\to 1} f(x)$  does not exist.
- **23.** True; by Theorem 1.5.5.
- **24.** False; e.g. f(x) = 1 if  $x \neq 3$ , f(3) = -1.
- **25.** False; e.g. f(x) = g(x) = 2 if  $x \neq 3$ , f(3) = 1, g(3) = 3.
- **26.** False; e.g. f(x) = g(x) = 2 if  $x \neq 3$ , f(3) = 1, g(3) = 4.
- **27.** True; use Theorem 1.5.3 with  $g(x) = \sqrt{f(x)}$ .
- 28. Generally, this statement is false because  $\sqrt{f(x)}$  might not even be defined. If we suppose that f(c) is nonnegative, and f(x) is also nonnegative on some interval  $(c-\alpha,c+\alpha)$ , then the statement is true. If f(c)=0 then given  $\epsilon>0$  there exists  $\delta>0$  such that whenever  $|x-c|<\delta,0\le f(x)<\epsilon^2$ . Then  $|\sqrt{f(x)}|<\epsilon$  and  $\sqrt{f}$  is continuous at x=c. If  $f(c)\ne 0$  then given  $\epsilon>0$  there corresponds  $\delta>0$  such that whenever  $|x-c|<\delta,|f(x)-f(c)|<\epsilon\sqrt{f(c)}$ . Then  $|\sqrt{f(x)}-\sqrt{f(c)}|=\frac{|f(x)-f(c)|}{|\sqrt{f(x)}+\sqrt{f(c)}|}\le \frac{|f(x)-f(c)|}{\sqrt{f(c)}}<\epsilon$ .
- **29.** (a) f is continuous for x < 1, and for x > 1;  $\lim_{x \to 1^-} f(x) = 5$ ,  $\lim_{x \to 1^+} f(x) = k$ , so if k = 5 then f is continuous for all x.
  - (b) f is continuous for x < 2, and for x > 2;  $\lim_{x \to 2^-} f(x) = 4k$ ,  $\lim_{x \to 2^+} f(x) = 4 + k$ , so if 4k = 4 + k, k = 4/3 then f is continuous for all x.
- **30.** (a) f is continuous for x < 3, and for x > 3;  $\lim_{x \to 3^-} f(x) = k/9$ ,  $\lim_{x \to 3^+} f(x) = 0$ , so if k = 0 then f is continuous for all x.
  - (b) f is continuous for x < 0, and for x > 0;  $\lim_{x \to 0^-} f(x)$  doesn't exist unless k = 0, and if so then  $\lim_{x \to 0^-} f(x) = 0$ ;  $\lim_{x \to 0^+} f(x) = 9$ , so there is no k value which makes the function continuous everywhere.

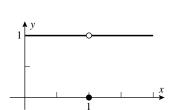

- **31.** f is continuous for x < -1, -1 < x < 2 and x > 2;  $\lim_{x \to -1^{-}} f(x) = 4, \lim_{x \to -1^{+}} f(x) = k$ , so k = 4 is required. Next,  $\lim_{x \to 2^{-}} f(x) = 3m + k = 3m + 4$ ,  $\lim_{x \to 2^{+}} f(x) = 9$ , so 3m + 4 = 9, m = 5/3 and f is continuous everywhere if k = 4 and m = 5/3.
- **32.** (a) No, f is not defined at x = 2. (b) No, f is not defined for  $x \le 2$ . (c) Yes. (d) No, see (b).

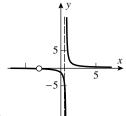

- **34.** (a)  $f(c) = \lim_{x \to c} f(x)$ 
  - **(b)**  $\lim_{x \to 1} f(x) = 2$ ,  $\lim_{x \to 1} g(x) = 1$ .

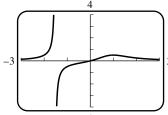

- (c) Define f(1) = 2 and redefine g(1) = 1.
- **35.** (a) x = 0,  $\lim_{x \to 0^-} f(x) = -1 \neq +1 = \lim_{x \to 0^+} f(x)$  so the discontinuity is not removable.
  - (b) x = -3; define  $f(-3) = -3 = \lim_{x \to -3} f(x)$ , then the discontinuity is removable.
  - (c) f is undefined at  $x = \pm 2$ ; at x = 2,  $\lim_{x \to 2} f(x) = 1$ , so define f(2) = 1 and f becomes continuous there; at x = -2,  $\lim_{x \to -2} f(x)$  does not exist, so the discontinuity is not removable.
- **36.** (a) f is not defined at x=2;  $\lim_{x\to 2} f(x) = \lim_{x\to 2} \frac{x+2}{x^2+2x+4} = \frac{1}{3}$ , so define  $f(2)=\frac{1}{3}$  and f becomes continuous there.
  - (b)  $\lim_{x\to 2^-} f(x) = 1 \neq 4 = \lim_{x\to 2^+} f(x)$ , so f has a nonremovable discontinuity at x=2.
  - (c)  $\lim_{x\to 1} f(x) = 8 \neq f(1)$ , so f has a removable discontinuity at x=1.

37. (a) Discontinuity at x = 1/2, not removable; at x = -3, removable.

**(b)** 
$$2x^2 + 5x - 3 = (2x - 1)(x + 3)$$

38. (a) There appears to be one discontinuity near x = -1.52.

(b) One discontinuity at  $x \approx -1.52$ .

**39.** Write  $f(x) = x^{3/5} = (x^3)^{1/5}$  as the composition (Theorem 1.5.6) of the two continuous functions  $g(x) = x^3$  and  $h(x) = x^{1/5}$ ; it is thus continuous.

**40.**  $x^4 + 7x^2 + 1 \ge 1 > 0$ , thus f(x) is the composition of the polynomial  $x^4 + 7x^2 + 1$ , the square root  $\sqrt{x}$ , and the function 1/x and is therefore continuous by Theorem 1.5.6.

**41.** Since f and g are continuous at x = c we know that  $\lim_{x \to c} f(x) = f(c)$  and  $\lim_{x \to c} g(x) = g(c)$ . In the following we use Theorem 1.2.2.

(a)  $f(c) + g(c) = \lim_{x \to c} f(x) + \lim_{x \to c} g(x) = \lim_{x \to c} (f(x) + g(x))$  so f + g is continuous at x = c.

(b) Same as (a) except the + sign becomes a - sign.

(c)  $f(c)g(c) = \lim_{x \to c} f(x) \lim_{x \to c} g(x) = \lim_{x \to c} f(x)g(x)$  so fg is continuous at x = c.

**42.** A rational function is the quotient f(x)/g(x) of two polynomials f(x) and g(x). By Theorem 1.5.2 f and g are continuous everywhere; by Theorem 1.5.3 f/g is continuous except when g(x) = 0.

**43.** (a) Let h = x - c, x = h + c. Then by Theorem 1.5.5,  $\lim_{h \to 0} f(h + c) = f(\lim_{h \to 0} (h + c)) = f(c)$ .

(b) With g(h) = f(c+h),  $\lim_{h\to 0} g(h) = \lim_{h\to 0} f(c+h) = f(c) = g(0)$ , so g(h) is continuous at h=0. That is, f(c+h) is continuous at h=0, so f is continuous at x=c.

**44.** The function h(x) = f(x) - g(x) is continuous on the interval [a, b], and satisfies h(a) > 0, h(b) < 0. The Intermediate Value Theorem or Theorem 1.5.9 tells us that there is at least one solution of the equation on this interval h(x) = 0, i.e. f(x) = g(x).

**45.** Of course such a function must be discontinuous. Let f(x) = 1 on  $0 \le x < 1$ , and f(x) = -1 on  $1 \le x \le 2$ .

**46.** (a) (i) No. (ii) Yes.

**(b)** (i) No. (ii) No.

(c) (i) No. (ii) No.

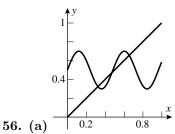

47. If  $f(x) = x^3 + x^2 - 2x - 1$ , then f(-1) = 1, f(1) = -1. The Intermediate Value Theorem gives us the result.

48. Since  $\lim_{x\to -\infty} p(x) = -\infty$  and  $\lim_{x\to +\infty} p(x) = +\infty$  (or vice versa, if the leading coefficient of p is negative), it follows that for M=-1 there corresponds  $N_1<0$ , and for M=1 there is  $N_2>0$ , such that p(x)<-1 for  $x< N_1$  and p(x)>1 for  $x>N_2$ . We choose  $x_1< N_1$  and  $x_2>N_2$  and use Theorem 1.5.9 on the interval  $[x_1,x_2]$  to show the existence of a solution of p(x)=0.

**49.** For the negative root, use intervals on the x-axis as follows: [-2, -1]; since f(-1.3) < 0 and f(-1.2) > 0, the midpoint x = -1.25 of [-1.3, -1.2] is the required approximation of the root. For the positive root use the interval [0, 1]; since f(0.7) < 0 and f(0.8) > 0, the midpoint x = 0.75 of [0.7, 0.8] is the required approximation.

**50.** For the negative root, use intervals on the x-axis as follows: [-2, -1]; since f(-1.7) < 0 and f(-1.6) > 0, use the interval [-1.7, -1.6]. Since f(-1.61) < 0 and f(-1.60) > 0 the midpoint x = -1.605 of [-1.61, -1.60] is the required approximation of the root. For the positive root use the interval [1, 2]; since f(1.3) > 0 and f(1.4) < 0, use the interval [1.3, 1.4]. Since f(1.37) > 0 and f(1.38) < 0, the midpoint x = 1.375 of [1.37, 1.38] is the required approximation.

- **51.** For the positive root, use intervals on the x-axis as follows: [2,3]; since f(2.2) < 0 and f(2.3) > 0, use the interval [2.2,2.3]. Since f(2.23) < 0 and f(2.24) > 0 the midpoint x = 2.235 of [2.23,2.24] is the required approximation of the root.
- **52.** Assume the locations along the track are numbered with increasing  $x \ge 0$ . Let  $T_S(x)$  denote the time during the sprint when the runner is located at point  $x, 0 \le x \le 100$ . Let  $T_J(x)$  denote the time when the runner is at the point x on the return jog, measured so that  $T_J(100) = 0$ . Then  $T_S(0) = 0$ ,  $T_S(100) > 0$ ,  $T_J(100) = 0$ ,  $T_J(0) > 0$ , so that Exercise 44 applies and there exists an  $x_0$  such that  $T_S(x_0) = T_J(x_0)$ .
- **53.** Consider the function  $f(\theta) = T(\theta + \pi) T(\theta)$ . Note that T has period  $2\pi$ ,  $T(\theta + 2\pi) = T(\theta)$ , so that  $f(\theta + \pi) = T(\theta + 2\pi) T(\theta + \pi) = -(T(\theta + \pi) T(\theta)) = -f(\theta)$ . Now if  $f(\theta) \equiv 0$ , then the statement follows. Otherwise, there exists  $\theta$  such that  $f(\theta) \neq 0$  and then  $f(\theta + \pi)$  has an opposite sign, and thus there is a  $t_0$  between  $\theta$  and  $\theta + \pi$  such that  $f(t_0) = 0$  and the statement follows.
- **54.** Let the ellipse be contained between the horizontal lines y=a and y=b, where a < b. The expression  $|f(z_1) f(z_2)|$  expresses the area of the ellipse that lies between the vertical lines  $x=z_1$  and  $x=z_2$ , and thus  $|f(z_1) f(z_2)| \le (b-a)|z_1 z_2|$ . Thus for a given  $\epsilon > 0$  there corresponds  $\delta = \epsilon/(b-a)$ , such that if  $|z_1 z_2| < \delta$ , then  $|f(z_1) f(z_2)| \le (b-a)|z_1 z_2| < (b-a)\delta = \epsilon$  which proves that f is a continuous function.
- **55.** Since R and L are arbitrary, we can introduce coordinates so that L is the x-axis. Let f(z) be as in Exercise 54. Then for large z, f(z) = area of ellipse, and for small z, f(z) = 0. By the Intermediate Value Theorem there is a  $z_1$  such that  $f(z_1)$  = half of the area of the ellipse.

- (b) Let g(x) = x f(x). Then g(x) is continuous,  $g(1) \ge 0$  and  $g(0) \le 0$ ; by the Intermediate Value Theorem there is a solution c in [0,1] of g(c) = 0, which means f(c) = c.
- **57.** For  $x \ge 0$ , f is increasing and so is one-to-one. It is continuous everywhere and thus by Theorem 1.5.7 it has an inverse defined on its range  $[5, +\infty)$  which is continuous there.
- **58.**  $L = h(0) = h(\lim_{x \to 0} f^{-1}(x)) = \lim_{x \to 0} h(f^{-1}(x)) = \lim_{x \to 0} \frac{f(f^{-1}(x))}{f^{-1}(x)} = \lim_{x \to 0} \frac{x}{f^{-1}(x)}.$

- **22.**  $\lim_{x\to 0} \frac{\sin^2 x}{3x^2} = \frac{1}{3} \left( \lim_{x\to 0} \frac{\sin x}{x} \right)^2 = \frac{1}{3}.$
- **23.**  $\lim_{x \to 0} \frac{\sin x^2}{x} = \left(\lim_{x \to 0} x\right) \left(\lim_{x \to 0} \frac{\sin x^2}{x^2}\right) = 0.$

24. 
$$\frac{\sin h}{1-\cos h} = \frac{\sin h}{1-\cos h} \cdot \frac{1+\cos h}{1+\cos h} = \frac{\sin h(1+\cos h)}{1-\cos^2 h} = \frac{1+\cos h}{\sin h}; \text{ this implies that } \lim_{h\to 0^+} \text{ is } +\infty, \text{ and } \lim_{h\to 0^-} \text{ is } -\infty,$$
 therefore the limit does not exist.

- 77. Let  $I_A$  and  $I_B$  be the intensities of the automobile and blender, respectively. Then  $\log_{10} I_A/I_0 = 7$  and  $\log_{10} I_B/I_0 = 7$ 9.3,  $I_A = 10^7 I_0$  and  $I_B = 10^{9.3} I_0$ , so  $I_B/I_A = 10^{2.3} \approx 200$ .
- **78.** First we solve  $120 = 10 \log(I/I_0)$  to find the intensity of the original sound:  $I = 10^{120/10}I_0 = 10^{12} \cdot 10^{-12} = 10^{120/10}I_0$ 1 W/m<sup>2</sup>. Hence the intensity of the n'th echo is  $(2/3)^n$  W/m<sup>2</sup> and its decibel level is  $10 \log \left(\frac{(2/3)^n}{10^{-12}}\right) =$  $10(n\log(2/3)+12)$ . Setting this equal to 10 gives  $n=-\frac{11}{\log(2/3)}\approx 62.5$ . So the first 62 echoes can be heard.

- **28.** (a) Given  $\epsilon > 0$  then  $|4x 7 1| < \epsilon$  provided  $|x 2| < \epsilon/4$ , take  $\delta = \epsilon/4$ .
  - (b) Given  $\epsilon > 0$  the inequality  $\left| \frac{4x^2 9}{2x 3} 6 \right| < \epsilon$  holds if  $|2x + 3 6| < \epsilon$ , or  $|x 1.5| < \epsilon/2$ , take  $\delta = \epsilon/2$ .

- **29.** Let  $\epsilon = f(x_0)/2 > 0$ ; then there corresponds a  $\delta > 0$  such that if  $|x x_0| < \delta$  then  $|f(x) f(x_0)| < \epsilon$ ,  $-\epsilon < f(x) f(x_0) < \epsilon$ ,  $f(x) > f(x_0) \epsilon = f(x_0)/2 > 0$ , for  $x_0 \delta < x < x_0 + \delta$ .
- - **(b)** cos 1
- **31.** (a) f is not defined at  $x = \pm 1$ , continuous elsewhere.
  - (b) None; continuous everywhere.
  - (c) f is not defined at x = 0 and x = -3, continuous elsewhere.
- **32.** (a) Continuous everywhere except  $x = \pm 3$ .
  - (b) Defined and continuous for  $x \le -1$ ,  $x \ge 1$ .
  - (c) Defined and continuous for x > 0.
- **33.** For x < 2 f is a polynomial and is continuous; for x > 2 f is a polynomial and is continuous. At x = 2,  $f(2) = -13 \neq 13 = \lim_{x \to 2^+} f(x)$ , so f is not continuous there.
- **35.** f(x) = -1 for  $a \le x < \frac{a+b}{2}$  and f(x) = 1 for  $\frac{a+b}{2} \le x \le b$ ; f does not take the value 0.
- **36.** If, on the contrary,  $f(x_0) < 0$  for some  $x_0$  in [0,1], then by the Intermediate Value Theorem we would have a solution of f(x) = 0 in  $[0, x_0]$ , contrary to the hypothesis.
- **37.** f(-6) = 185, f(0) = -1, f(2) = 65; apply Theorem 1.5.8 twice, once on [-6, 0] and once on [0, 2].
- **38.** (a)  $x = f(y) = (e^y)^2 + 1$ ;  $f^{-1}(x) = y = \ln \sqrt{x 1} = \frac{1}{2} \ln(x 1)$ .
  - **(b)**  $x = f(y) = \sin\left(\frac{1-2y}{y}\right); f^{-1}(x) = y = \frac{1}{2+\sin^{-1}x}.$
  - (c)  $x = \frac{1}{1+3\tan^{-1}y}$ ;  $y = \tan\left(\frac{1-x}{3x}\right)$ . The range of f consists of all  $x < \frac{-2}{3\pi-2}$  or  $> \frac{2}{3\pi+2}$ , so this is also the domain of  $f^{-1}$ . Hence  $f^{-1}(x) = \tan\left(\frac{1-x}{3x}\right)$ ,  $x < \frac{-2}{3\pi-2}$  or  $x > \frac{2}{3\pi+2}$ .
- **39.** Draw right triangles of sides 5, 12, 13, and 3, 4, 5. Then  $\sin[\cos^{-1}(4/5)] = 3/5$ ,  $\sin[\cos^{-1}(5/13)] = 12/13$ ,  $\cos[\sin^{-1}(4/5)] = 3/5$ , and  $\cos[\sin^{-1}(5/13)] = 12/13$ .
  - (a)  $\cos[\cos^{-1}(4/5) + \sin^{-1}(5/13)] = \cos(\cos^{-1}(4/5))\cos(\sin^{-1}(5/13) \sin(\cos^{-1}(4/5))\sin(\sin^{-1}(5/13))) = \frac{4}{5}\frac{12}{13} \frac{3}{5}\frac{5}{13} = \frac{33}{65}$ .
  - (b)  $\sin[\sin^{-1}(4/5) + \cos^{-1}(5/13)] = \sin(\sin^{-1}(4/5))\cos(\cos^{-1}(5/13)) + \cos(\sin^{-1}(4/5))\sin(\cos^{-1}(5/13)) = \frac{4}{5}\frac{5}{13} + \frac{3}{13}\frac{12}{13} = \frac{56}{65}$ .

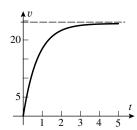

- **41.** y = 5 ft = 60 in, so  $60 = \log x$ ,  $x = 10^{60}$  in  $\approx 1.58 \times 10^{55}$  mi.
- **42.**  $y = 100 \text{ mi} = 12 \times 5280 \times 100 \text{ in}$ , so  $x = \log y = \log 12 + \log 5280 + \log 100 \approx 6.8018 \text{ in}$ .
- **43.**  $3\ln\left(e^{2x}(e^x)^3\right) + 2\exp(\ln 1) = 3\ln e^{2x} + 3\ln(e^x)^3 + 2\cdot 1 = 3(2x) + (3\cdot 3)x + 2 = 15x + 2.$
- **44.**  $Y = \ln(Ce^{kt}) = \ln C + \ln e^{kt} = \ln C + kt$ , a line with slope k and Y-intercept  $\ln C$ .

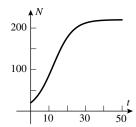

45. (a)

(b) The curve  $y = e^{-x/2} \sin 2x$  has x-intercepts at  $x = -\pi/2, 0, \pi/2, \pi, 3\pi/2$ . It intersects the curve  $y = e^{-x/2}$  at  $x = \pi/4, 5\pi/4$  and it intersects the curve  $y = -e^{-x/2}$  at  $x = -\pi/4, 3\pi/4$ .

46. (a)

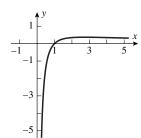

- (b) As t gets larger, the velocity v grows towards 24.61 ft/s.
- (c) For large t the velocity approaches c = 24.61.
- (d) No; but it comes very close (arbitrarily close).
- (e) 3.009 s.

47. (a)

**(b)** N = 80 when t = 9.35 yrs.

- (c) 220 sheep.
- 48. (a) The potato is done in the interval 27.65 < t < 32.71.
  - (b) The oven temperature is always  $400^{\circ}$  F, so the difference between the oven temperature and the potato temperature is D = 400 T. Initially D = 325, so solve D = 75 + 325/2 = 237.5 for t, so  $t \approx 22.76$  min.
- **49.** (a) The function  $\ln x x^{0.2}$  is negative at x = 1 and positive at x = 4, so by the intermediate value theorem it is zero somewhere in between.
  - **(b)** x = 3.654 and 332105.108.

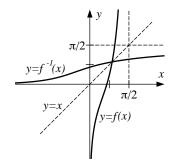

50. (a)

(b)

If  $x^k = e^x$  then  $k \ln x = x$ , or  $\frac{\ln x}{x} = \frac{1}{k}$ . The steps are reversible.

- (b) By zooming it is seen that the maximum value of y is approximately 0.368 (actually, 1/e), so there are two distinct solutions of  $x^k = e^x$  whenever k > e.
- (c)  $x \approx 1.155, 26.093.$
- **51.** (a) The functions  $x^2$  and  $\tan x$  are positive and increasing on the indicated interval, so their product  $x^2 \tan x$  is also increasing there. So is  $\ln x$ ; hence the sum  $f(x) = x^2 \tan x + \ln x$  is increasing, and it has an inverse.

The asymptotes for f(x) are x = 0,  $x = \pi/2$ . The asymptotes for  $f^{-1}(x)$  are y = 0,  $y = \pi/2$ .

## **Chapter 1 Making Connections**

1. Let  $P(x, x^2)$  be an arbitrary point on the curve, let  $Q(-x, x^2)$  be its reflection through the y-axis, let O(0,0) be the origin. The perpendicular bisector of the line which connects P with O meets the y-axis at a point  $C(0, \lambda(x))$ , whose ordinate is as yet unknown. A segment of the bisector is also the altitude of the triangle  $\triangle OPC$  which is isosceles, so that CP = CO.

Using the symmetrically opposing point Q in the second quadrant, we see that  $\overline{OP} = \overline{OQ}$  too, and thus C is equidistant from the three points O, P, Q and is thus the center of the unique circle that passes through the three points.

**2.** Let R be the midpoint of the line segment connecting P and O, so that  $R(x/2, x^2/2)$ . We start with the Pythagorean Theorem  $\overline{OC}^2 = \overline{OR}^2 + \overline{CR}^2$ , or  $\lambda^2 = (x/2)^2 + (x^2/2)^2 + (x/2)^2 + (\lambda - x^2/2)^2$ . Solving for  $\lambda$  we obtain  $\lambda x^2 = (x^2 + x^4)/2$ ,  $\lambda = 1/2 + x^2/2$ .

- 3. Replace the parabola with the general curve y=f(x) which passes through P(x,f(x)) and S(0,f(0)). Let the perpendicular bisector of the line through S and P meet the y-axis at  $C(0,\lambda)$ , and let  $R(x/2,(f(x)-\lambda)/2)$  be the midpoint of P and S. By the Pythagorean Theorem,  $\overline{CS}^2=\overline{RS}^2+\overline{CR}^2$ , or  $(\lambda-f(0))^2=x^2/4+\left[\frac{f(x)+f(0)}{2}-f(0)\right]^2+x^2/4+\left[\frac{f(x)+f(0)}{2}-\lambda\right]^2$ , which yields  $\lambda=\frac{1}{2}\left[f(0)+f(x)+\frac{x^2}{f(x)-f(0)}\right]$ .
- **4.** (a)  $f(0) = 0, C(x) = \frac{1}{8} + 2x^2, x^2 + (y \frac{1}{8})^2 = (\frac{1}{8})^2$ .
  - **(b)**  $f(0) = 0, C(x) = \frac{1}{2}(\sec x + x^2), x^2 + (y \frac{1}{2})^2 = (\frac{1}{2})^2.$
  - (c)  $f(0) = 0, C(x) = \frac{1}{2} \frac{x^2 + |x|^2}{|x|}, x^2 + y^2 = 0$  (not a circle).
  - (d)  $f(0) = 0, C(x) = \frac{1}{2} \frac{x(1 + \sin^2 x)}{\sin x}, x^2 + \left(y \frac{1}{2}\right)^2 = \left(\frac{1}{2}\right)^2.$
  - (e)  $f(0) = 1, C(x) = \frac{1}{2} \frac{x^2 \sin^2 x}{\cos x 1}, x^2 + y^2 = 1.$
  - (f)  $f(0) = 0, C(x) = \frac{1}{2g(x)} + \frac{x^2g(x)}{2}, x^2 + \left(y \frac{1}{2g(0)}\right)^2 = \left(\frac{1}{2g(0)}\right)^2.$
  - (g)  $f(0) = 0, C(x) = \frac{1}{2} \frac{1 + x^6}{x^2}$ , limit does not exist, osculating circle does not exist.
