Chapter 2

Job-Order Costing: Calculating Unit Product Costs

Questions

- **2-1** Job-order costing is used in situations where many different products, each with individual and unique features, are produced each period.
- **2-2** In absorption costing, all manufacturing costs, both fixed and variable, are assigned to units of product—units are said to *fully absorb manufacturing costs*. Conversely, all nonmanufacturing costs are treated as period costs and they are not assigned to units of product.
- **2-3** Normal costing systems apply overhead costs to jobs by multiplying a predetermined overhead rate by the actual amount of the allocation incurred by the job.
- **2-4** Unit product cost is computed by taking the total manufacturing costs assigned to a job and dividing it by the number of units contained in the job.
- **2-5** The first step is to estimate the total amount of the allocation base (the denominator) that will be required for next period's estimated level of production. The second step is to estimate the total fixed manufacturing overhead cost for the coming period and the variable manufacturing overhead cost per unit of the allocation base. The third step is to use the cost formula Y = a + bX to estimate the total manufacturing overhead cost (the numerator) for the coming period. The fourth step is to compute the predetermined overhead rate.
- **2-6** The job cost sheet is used to record all product costs that are assigned to a particular job. These they more on the McGraw-Hill Companies, Inc., 2018. All rights reserved.

- costs include direct materials costs traced to the job, direct labor costs traced to the job, and manufacturing overhead costs applied to the job. When a job is completed, the job cost sheet is used to compute the unit product cost.
- **2-7** Some production costs such as a factory manager's salary cannot be traced to a particular product or job, but rather are incurred as a result of overall production activities. In addition, some production costs such as indirect materials cannot be easily traced to jobs. If these costs are to be assigned to products, they must be allocated to the products.
- **2-8** If actual manufacturing overhead cost is applied to jobs, the company must wait until the end of the accounting period to apply overhead and to cost jobs. If the company computes actual overhead rates more frequently to get around this problem, the rates may fluctuate widely due to seasonal factors or variations in output. For this reason, most companies use predetermined overhead rates to apply manufacturing overhead costs to jobs.
- **2-9** The measure of activity used as the allocation base should drive the overhead cost; that is, the allocation base should cause the overhead cost. If the allocation base does not really cause the overhead, then costs will be incorrectly attributed to products and jobs and product costs will be distorted.
- **2-10** Assigning manufacturing overhead costs to jobs does not ensure a profit. The units produced may not be sold and if they are sold, they may not be sold at prices sufficient to cover

- all costs. It is a myth that assigning costs to products or jobs ensures that those costs will be recovered. Costs are recovered only by selling to customers—not by allocating costs.
- **2-11** No, you would not expect the total applied overhead for a period to equal the actual overhead for that period. This is because the applied overhead relies on a predetermined overhead rate that is based on estimates in the numerator and denominator.
- **2-12** When a company applied less overhead to production than it actually incurs, it creates what is known as underapplied overhead. When it applies more overhead to production than it actually incurs, it results in overapplied overhead.
- **2-13** A plantwide overhead rate is a single overhead rate used throughout a plant. In a multiple overhead rate system, each production department may have its own predetermined overhead rate and its own allocation base. Some companies use multiple overhead rates rather than plantwide rates to more appropriately allocate overhead costs among products. Multiple overhead rates should be used, for example, in situations where one department is machine intensive and another department is labor intensive.

	Manufacturing overhead applied				
7		\$630.00	\$200.00	\$830.00	
	Total cost of Job 407			\$2,350.00	
)	Step 5: Calculate the selling price for Job 407				
	Total cost of Job 407			\$2,350.00	
	Markup			\$1,762.50	
	Walkup				
	Selling price of Job 407			\$4,112.50	

The selling price of Job 407 has dropped from \$4,348.75 to \$4,112.50 because the fixed manufacturing overhead in the Milling Department decreased from \$390,000 to \$300,000. This reduced the predetermined overhead rate in the Milling Department from \$8.50 per machine-hour to \$7.00 per machine-hour and hence the amount of overhead applied to Job 407 in the Milling Department.

2		Milling	Assembly		
	Total manufacturing overhead	\$510,000	\$800,000		
1	Total machine-hours or direct labor-hours	60,000	80,000		
5	Predetermined overhead rate per machine-hour or direct labor-hour	\$8.50	\$10.00		
5		75.50	7.2.20	1	
7	Step 3: Calculate the amount of overhead applied from both depar	tments to Joh	408		
3	otop 5. Salvanato dio amount of overhead applied from both depair	Milling	Assembly		
	Predetermined overhead rate per machine-hour or direct labor-hour	\$8.50	\$10.00		
)	Machine-hours or direct labor-hours for the job	40	6		
1	Manufacturing overhead applied	\$340.00	\$60.00	-	
)	ivianulacturing overneau applieu	φ340.00	400.00		
	Stop 4: Calculate the total ich cost for Joh 400		(A)	0.	
3	Step 4: Calculate the total job cost for Job 408	M:II:	Annarchi	Total	
1	Direct metarials	Milling	Assembly	Total	
	Direct materials	\$700.00	\$360.00	\$1,060.00	
	Direct labor cost	\$50.00	\$150.00	\$200.00	
	Manufacturing overhead applied	\$340.00	\$60.00	\$400.00	
	Total cost of Job 408			\$1,660.00	
)					
)	Step 5: Calculate the selling price for Job 408				
	Total cost of Job 408			\$1,660.00	
2	Markup			\$1,245.00	
	Selling price of Job 408			\$2,905.00	

The selling price for Job 408 is not affected by this change. The reason for this is that the total number of machine-hours in the Assembly Department has no effect on any cost. There would have been a change in costs and in the selling price if the total machine-hours in the Milling Department would have changed. This is because the predetermined overhead rate in that department is based on machine-hours and any change in the total machine-hours would affect the magnitude of the predetermined overhead rate in that department.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

4. When the total number of direct labor-hours in the Assembly Department decreases from 80,000 direct labor-hours to 50,000 direct labor-hours, the worksheet looks like the following:

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Chapter 2: Applying Excel (continued)

© The McGraw-Hill Companies, Inc., 2018. All rights reserved.

The selling price of Job 408 has increased from \$2,905.00 to \$2,944.38. This occurs because the decrease in the total number of direct laborhours in the Assembly Department increases the predetermined overhead rate in that department from \$10.00 per direct labor-hour to \$13.75 per direct labor-hour. In effect, the same total fixed manufacturing overhead cost is spread across fewer total direct laborhours.

The Foundational 15

1. The first step is to calculate the estimated total overhead costs in Molding and Fabrication:

Molding: Using the equation Y = a + bX, the estimated total manufacturing overhead cost is computed as follows:

$$Y = $10,000 + ($1.40 per MH)(2,500 MHs)$$

Estimated fixed manufacturing overhead	\$10,000
Estimated variable manufacturing overhead: \$1.40 per MH × 2,500 MHs	3,500
Estimated total manufacturing overhead cost	\$13,500

Fabrication: Using the equation Y = a + bX, the estimated total manufacturing overhead cost is computed as follows:

$$Y = $15,000 + ($2.20 per MH)(1,500 MHs)$$

Estimated fixed manufacturing overhead	\$15,000
Estimated variable manufacturing overhead:	
\$2.20 per MH × 1,500 MHs	3,300
Estimated total manufacturing overhead cost	<u>\$18,300</u>

The second step is to combine the estimated manufacturing overhead costs in Molding and Fabrication (\$13,500 + \$18,300 = \$31,800) to enable calculating the predetermined overhead rate as follows:

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Estimated total manufacturing overhead (a).... \$31,800 Estimated total machine-hours (MHs) (b)....... 4,000 MHs Predetermined overhead rate (a) \div (b)....... \$7.95 per MH

2. The manufacturing overhead applied to Jobs P and Q is computed as follows:

	Job P	Job Q
Actual machine-hours worked (a)	2,300	1,700
Predetermined overhead rate per MH (b)	\$7.95	\$7.95
Manufacturing overhead applied (a) \times (b)	\$18,285	\$13,515

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

The Foundational 15

3. The total manufacturing cost assigned to Job P is computed as follows:

	Job P
Direct materials	\$13,000
Direct labor	21,000
Manufacturing overhead applied	18,285
Total manufacturing cost	<u>\$52,285</u>

4. Job P's unit product cost is computed as follows:

	JUD P
Total manufacturing cost (a)	\$52,285
Number of units (b)	20
Unit product cost (rounded) (a) ÷ (b)	\$2,614

5. The total manufacturing cost assigned to Job Q is computed as follows:

Toh D

Toh D

	JOD P
Direct materials	\$ 8,000
Direct labor	7,500
Manufacturing overhead applied	<u>13,515</u>
Total manufacturing cost	<u>\$29,015</u>

6. Job Q's unit product cost is computed as follows:

	JOD P
Total manufacturing cost (a)	\$29,015
Number of units (b)	30

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

The product cost (rounded) (a) r (b) in this in the	Unit product cost ((rounded)) (a) ÷ (b`)	\$967
---	---------------------	-----------	------	-------	----	---	-------

7. The selling prices are calculated as follows:

	Job P	Job Q
Total manufacturing cost	\$52,285	\$29,015
Markup (based on 80%)	41,828	23,212
Total price for the job (a)	\$94,113	\$52,227
Number of units in the job (b)	20	30
Selling price per unit (rounded) (a) ÷ (b)	\$4,706	\$1,741

The Foundational 15

8. The cost of goods sold is the sum of the manufacturing costs assigned to Jobs P and Q:

Total manufacturing cost assigned to Job P	\$52,285
Total manufacturing cost assigned to Job Q	29,015
Cost of goods sold	\$81,300

9. Molding: Using the equation Y = a + bX, the estimated total manufacturing overhead cost is computed as follows:

$$Y = $10,000 + ($1.40 per MH)(2,500 MHs)$$

Estimated fixed manufacturing overhead	\$10,000
Estimated variable manufacturing overhead:	
\$1.40 per MH × 2,500 MHs	3,500

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

The predetermined overhead rate in Molding is computed as follows:

Estimated total manufacturing overhead (a).... \$13,500

Estimated total machine-hours (MHs) (b)...... 2,500 MHs

Predetermined overhead rate (a) ÷ (b)...... \$5.40 per MH

Fabrication: Using the equation Y = a + bX, the estimated total manufacturing overhead cost is computed as follows:

Y = \$15,000 + (\$2.20 per MH)(1,500 MHs)

Estimated fixed manufacturing overhead...... \$15,000

Estimated variable manufacturing overhead:

Estimated total manufacturing overhead cost............. \$18,300

The predetermined overhead rate in Fabrication is computed as follows:

Estimated total manufacturing overhead (a).... \$18,300

Estimated total machine-hours (MHs) (b)...... 1,500 MHs

Predetermined overhead rate (a) ÷ (b)...... \$12.20 per MH

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

The Foundational 15

10. The applied overhead from Molding is computed as follows:

	Job P	Job Q
Machine-hours worked on job (a)	1,700	800
Molding overhead rate (b)	\$5.40	\$5.40
Manufacturing overhead applied (a) \times (b)	\$9,180	\$4,320

11. The applied overhead from Fabrication is computed as follows:

	Job P	Job Q
Machine-hours worked on job (a)	600	900
Fabrication overhead rate (b)	\$12.20	\$12.20
Manufacturing overhead applied (a) \times (b)	\$7,320	\$10,980

12. The unit product cost for Job P is computed as follows:

Direct materials		\$13,000
Direct labor		21,000
Manufacturing overhead applied:		
Molding Department	\$9,180	
Fabrication Department	<u>7,320</u>	16,500
Total manufacturing cost (a)		\$50,500
Number of units in the job (b)		20
Unit product cost (a) ÷ (b)		\$2,525

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

13. The unit product cost for Job Q is computed as follows:

Direct materials		\$8,000
Direct labor		7,500
Manufacturing overhead applied:		
Molding Department	\$4,320	
Fabrication Department	10,980	<u>15,300</u>
Total manufacturing cost (a)		\$30,800
Number of units in the job (b)		30
Unit product cost (rounded) (a) ÷ (b)		\$1,027

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

The Foundational 15

14. The selling prices are calculated as follows:

	Job P	Job Q
Total manufacturing cost	\$50,500	\$30,800
Markup (based on 80%)	40,400	24,640
Total price for the job (a)	\$90,900	\$55,440
Number of units in the job (b)	20	30
Selling price per unit (a) ÷ (b)	\$4,545	\$1,848

15. The cost of goods sold is the sum of the manufacturing costs assigned to Jobs P and Q:

Total manufacturing cost assigned to Job P	\$50,500
Total manufacturing cost assigned to Job Q	30,800
Cost of goods sold	<u>\$81,300</u>

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-1 (10 minutes)

The estimated total manufacturing overhead cost is computed as follows:

$$Y = $94,000 + ($2.00 per DLH)(20,000 DLHs)$$

Estimated fixed manufacturing overhead	\$ 94,000
Estimated variable manufacturing overhead: \$2.00	
per DLH × 20,000 DLHs	40,000
Estimated total manufacturing overhead cost	\$134,000

The plantwide predetermined overhead rate is computed as follows:

Estimated total manufacturing overhead (a)..... \$134,000 Estimated total direct labor hours (b)............ 20,000 DLHs Predetermined overhead rate (a) \div (b)........... \$6.70 per DLH

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-2 (10 minutes)

Actual direct labor-hours (a)	10,800
Predetermined overhead rate (b)	\$23.40
Manufacturing overhead applied (a) \times (b)	\$252,720

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-3 (10 minutes)

1.	Total	direct	labor-hours	required	for	Job	A-500:
----	-------	--------	-------------	----------	-----	-----	--------

Direct labor cost (a)	\$153
Direct labor wage rate per hour (b)	\$17
Total direct labor hours (a) ÷ (b)	9

Total manufacturing cost assigned to Job A-500:

Direct materials	\$231
Direct labor	153
Manufacturing overhead applied (\$14 per DLH × 9 DLHs)	<u>126</u>
Total manufacturing cost	<u>\$510</u>

2. Unit product cost for Job A-500:

Total manufacturing cost (a)	\$510
Number of units in the job (b)	40
Unit product cost (a) ÷ (b)	\$12.75

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-4 (10 minutes)

1 and 2.

The total direct labor-hours required for Job N-60:

	Assembly	Testing & Packaging
Direct labor cost (a)	\$180	\$40
Direct labor wage rate per hour (b)	\$20	\$20
Total direct labor hours (a) ÷ (b)	9	2

The total manufacturing cost and unit product cost for Job N-60 is computed as follows:

	\$365
	220
\$144	
24	<u>168</u>
	<u>\$753</u>
	\$753
	Φ/ 33
	10
	\$75.30
	'

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-5 (10 minutes)

1 and 2.

The total direct labor-hours required in Finishing for Job 700:

	Finishing
Direct labor cost (a)	\$128
Direct labor wage rate per hour (b)	\$16
Total direct labor hours (a) ÷ (b)	8

The total manufacturing cost and unit product cost for Job 700 is computed as follows:

Direct materials (\$410 + \$60)		\$470
Direct labor (\$128 + \$48)		176
Finishing Department (\$18 per DLH \times 8 DLHs)	\$144	
Fabrication Department (110% × \$60)	66	210
Total manufacturing cost		<u>\$856</u>
Total manufacturing cost (a)		\$856
Number of units in the job (b)		15
Unit product cost (rounded) (a) ÷ (b)		\$57.07

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-6 (10 minutes)

1. The estimated total overhead cost is computed as follows:

Y = \$680,000 + (\$0.50 per DLH)(80,000 DLHs)

Estimated fixed overhead cost	\$680,000
Estimated variable overhead cost: \$0.50 per DLH × 80,000 DLHs	40,000
00,000 DLI IS	
Estimated total overhead cost	\$720,000

The predetermined overhead rate is computed as follows:

Estimated total overhead (a).....

Total manufacturing cost.....

	•
Estimated total direct labor-hours (b)	80,000 DLHs
Predetermined overhead rate (a) ÷ (b)	\$9.00 per DLH
2. Total manufacturing cost assigned to Xavier:	
Direct materials	. \$38,000
Direct labor	21,000
Overhead applied (\$9.00 per DLH × 280 DLHs)	. 2,520

\$61,520

\$720,000

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-7 (20 minutes)

1. Step 1: The total direct labor-hours required for Job Omega:

Direct labor cost (a)	\$345,000
Direct labor wage rate per hour (b)	\$15
Total direct labor hours worked (a) ÷ (b)	23,000

Step 2: Derive the plantwide predetermined overhead rate:

Manufacturing overhead applied to Job Omega (a)		
Omega (a)	\$184,000	
Direct labor hours worked on Job Omega (b).	23,000	
Plantwide predetermined overhead rate (a) ÷ (b)		
(4)	\$8.00	per DLH

2. The job cost sheet for Job Alpha is derived as follows: (note that direct materials is the plug figure)

Direct materials (plug figure)	\$ 280,000
Direct labor (54,500 DLHs \times \$15 per DLH)	817,500
Manufacturing overhead applied (\$8 per DLH × 54,500 DLHs)	436,000
Total job cost (given)	\$1,533,500

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-8 (10 minutes)

Direct material	\$10,000
Direct labor	12,000
Manufacturing overhead applied:	
\$12,000 × 125%	15,000
Total manufacturing cost	<u>\$37,000</u>
Total manufacturing cost (a)	\$37,000
Number of units in job (b)	1,000
Unit product cost (a) ÷ (b)	\$37

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-9 (30 minutes)

1. The estimated total overhead cost is computed as follows:

$$Y = $1,980,000 + ($2.00 per MH)(165,000 MHs)$$

Estimated	fixed overhead	\$1,980,000
	variable overhead: \$2.00 per MH × MHs	330 000
,		
Estimated	total overhead cost	\$2,310,000

The plantwide predetermined overhead rate is computed as follows:

Estimated total overhead (a)	\$2,310,000	
Estimated total machine-hours (b)	165,000	MHs
Predetermined overhead rate (a) ÷ (b)	\$14.00	per MH

2. Total manufacturing cost assigned to Job P90:

Direct materials	\$1,150
Direct labor	830
Overhead applied (\$14 per MH \times 72 MHs)	1,008
Total manufacturing cost	<u>\$2,988</u>

3a. Given that the company is operating at 50% of its manufacturing capacity, an argument can made that the company should pursue any business opportunities that generate a positive a contribution margin. Based on the information provided, it appears that Job P90 does generate a positive contribution margin as shown below:

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Sales	\$2,500
Direct materials	\$1,150
Direct labor	830
Variable overhead applied (\$2.00 per MH × 72 MHs)	<u>144 2,124</u>
Contribution margin	<u>\$ 376</u>

Exercise 2-9 (continued)

3b. The CFO's argument is based on the assertion that Job P90 does not generate enough revenue to cover the cost of the manufacturing resources that it consumes. However, given that the company is operating at 50% of its manufacturing capacity, the overhead costs applied to Job P90 in requirement 2 do not represent the cost of the overhead resources consumed making Job P90. In other words, the overhead applied in requirement 2 includes a charge for used and unused capacity. This reality provides instructors an opportunity to introduce students to the main idea underlying Appendix 2B.

If we estimate a capacity-based overhead rate for the company and apply overhead costs to Job P90 using this rate, it reveals that the revenue generated by the job (\$2,500) is still insufficient to cover its manufacturing costs of \$2,556, as computed below:

The estimated total overhead cost (at capacity) is computed as follows (keep in mind that $165,000 \text{ MHs} \div 50\% = 330,000 \text{ MHs}$):

Y = \$1,980,000 + (\$2.00 per MH)(330,000 MHs)

Estimated fixed overhead	\$1,980,000
Estimated variable overhead: \$2.00 per MH ×	
330,000 MHs	660,000
Estimated total overhead cost	\$2,640,000

The predetermined capacity-based overhead rate is computed as follows:

Estimated total overhead (a)	\$2,640,000	
Estimated total machine-hours (b)	330,000	MHs
Predetermined overhead rate (a) ÷ (b)	\$8.00	per MH

© The McGraw-Hill Companies, Inc., 2018. All rights reserved.

The total manufacturing cost assigned to Job P90 (using a capacity-based overhead rate):

Direct materials	\$1,150
Direct labor	830
Overhead applied (\$8 per MH \times 72 MHs)	<u>576</u>
Total manufacturing cost	<u>\$2,556</u>

Exercise 2-10 (10 minutes)

1. Yes, overhead should be applied to Job W at year-end.

Because \$6,000 of overhead was applied to Job V on the basis of \$8,000 of direct labor cost, the company's predetermined overhead rate must be 75% of direct labor cost.

Job W direct labor cost (a)	\$4,000
Predetermined overhead rate (b)	0.75
Manufacturing overhead applied to Job W (a) \times (b)	\$3,000

2. The direct materials (\$2,500), direct labor (\$4,000), and applied overhead (\$3,000) for Job W will be included in Work in Process on Sigma Corporation's balance sheet.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-11 (30 minutes)

Note to the instructor: This exercise can be used as a launching pad for a discussion of Appendix 2B.

1. The estimated total fixed manufacturing overhead can be computed using the data from any of quarters 1-3. For illustrative purposes, we'll use the first quarter as follows:

Total overhead cost (First quarter)	\$300,000
Variable cost element ($$2.00$ per unit \times 80,000 units).	_160,000
Fixed cost element	\$140,000

2. The fixed and variable cost estimates from requirement 1 can be used to estimate the total manufacturing overhead cost for the fourth quarter as follows:

Y = \$140,000 + (\$2.00 per unit)(60,000 units)

Estimated fixed manufacturing overhead	\$140,000
Estimated variable manufacturing overhead	
\$2.00 per unit × 60,000 units	_120,000
Estimated total manufacturing overhead cost	\$260,000

The estimated unit product cost for the fourth quarter is computed as follows:

Direct materials...... \$180,000

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Direct labor	96,000
Manufacturing overhead	260,000
Total manufacturing costs (a)	\$536,000
Number of units to be produced (b)	60,000
Unit product cost (rounded) (a) ÷ (b)	\$8.93

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-11 (continued)

- 3. The fixed portion of the manufacturing overhead cost is causing the unit product costs to fluctuate. The unit product cost increases as the level of production decreases because the fixed overhead is spread over fewer units.
- 4. The unit product cost can be stabilized by using a predetermined overhead rate that is based on expected activity for the entire year. The cost formula created in requirement 1 can be adapted to compute the annual predetermined overhead rate. The annual fixed manufacturing overhead is \$560,000 (\$140,000 per quarter × 4 quarters). The variable manufacturing overhead per unit is \$2.00. The cost formula is as follows:

 $Y = $560,000 + ($2.00 per unit \times 200,000 units)$

Estimated fixed manufacturing overhead	\$560,000
Estimated variable manufacturing overhead	
\$2.00 per unit × 200,000 units	400,000
Estimated total manufacturing overhead cost	\$960,000

The annual predetermined overhead rate is computed as follows:

Estimated total manufacturing overhead (a)	\$960,000	
Estimated total units produced (b)	200,000	
Predetermined overhead rate (a) ÷ (b)	\$4.80	per unit

Using a predetermined overhead rate of \$4.80 per unit, the unit product costs would stabilize as shown below:

© The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Quarter

	First	Second	Third	Fourth
Direct materials	\$240,000	\$120,000	\$ 60,000	\$180,000
Direct labor	128,000	64,000	32,000	96,000
Manufacturing overhead: at \$4.80 per unit	384,000	192,000	96,000	288,000
Total cost (a)	<u>\$752,000</u>	<u>\$376,000</u>	<u>\$188,000</u>	<u>\$564,000</u>
Number of units produced (b)	80,000	40,000	20,000	60,000
Unit product cost (a) \div (b).	<u>\$9.40</u>	<u>\$9.40</u>	<u>\$9.40</u>	<u>\$9.40</u>

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-12 (20 minutes)

1. The estimated total manufacturing overhead cost is computed as follows:

Y = \$650,000 + (\$3.00 per MH)(100,000 MHs)

Estimated fixed manufacturing overhead	\$650,000
Estimated variable manufacturing overhead: \$3.00	200 000
per MH × 100,000 MHs	300,000
Estimated total manufacturing overhead cost	\$950,000

The plantwide predetermined overhead rate is computed as follows:

Estimated total manufacturing overhead (a). . \$950,000

Estimated total machine-hours (b)	100,000	MHs
Predetermined overhead rate (a) ÷ (b)	\$9.50	per MH
2. Total manufacturing cost assigned to Job 400:		
Direct materials	\$	450
Direct labor		210
Manufacturing overhead applied (\$9.50 per MH × 4	10	
MHs)	–	<u>380</u>
Total manufacturing cost	<u>\$1</u>	<u>,040</u>

3. The unit product cost of Job 400 is computed as follows:

Total manufacturing cost (a)	\$1,040
Number of units in the job (b)	52

 $[\]hbox{@}$ The McGraw-Hill Companies, Inc., 2018. All rights reserved.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-12 (continued)

5. Possible critiques of Moody's pricing tactics include (1) relying on a plantwide overhead rate to allocate overhead costs to jobs may distort the cost base used for cost-plus pricing, (2) relying on an absorption approach may allocate unused capacity costs to jobs thereby distorting the cost base for cost-plus pricing, and (3) relying on absorption cost-plus pricing ignores the customers' willingness to pay based on their perceived value of the product or service.

Exercise 2-13 (20 minutes)

1. Cutting Department:

The estimated total manufacturing overhead cost in the Cutting Department is computed as follows:

$$Y = $264,000 + ($2.00 per MH)(48,000 MHs)$$

Estimated fixed manufacturing overhead	\$264,000
Estimated variable manufacturing overhead	
\$2.00 per MH × 48,000 MHs	<u>96,000</u>
Estimated total manufacturing overhead cost	\$360,000

The predetermined overhead rate is computed as follows:

Estimated total manufacturing overhead (a)	\$360,000	
Estimated total machine-hours (b)	48,000	MHs
Predetermined overhead rate (a) ÷ (b)	\$7.50	per MH

Finishing Department:

The estimated total manufacturing overhead cost in the Finishing Department is computed as follows:

$$Y = $366,000 + ($4.00 per DLH)(30,000 DLHs)$$

Estimated variable manufacturing overhead

 $[\]hbox{@}$ The McGraw-Hill Companies, Inc., 2018. All rights reserved.

The predetermined overhead rate is computed as follows:

Estimated total manufacturing overhead (a)... \$486,000

Predetermined overhead rate (a) ÷ (b)........ \$16.20 per DLH

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-13 (continued)

2. Total manufacturing cost assigned to Job 203:

Direct materials (\$500 + \$310)		\$ 810
Direct labor (\$108 + \$360)		468
Cutting Department (80 MHs \times \$7.50 per MH)	\$600	
Finishing Department (20 DLH × \$16.20 per DLH)	324	924
Total manufacturing cost	=	<u>\$2,202</u>

3. Yes; if some jobs require a large amount of machine time and a small amount of labor time, they would be charged substantially less overhead cost if a plantwide overhead rate based on direct labor hours were used. It appears, for example, that this would be true of Job 203 which required considerable machine time to complete, but required a relatively small amount of labor hours.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-14 (10 minutes)

1. The estimated total overhead cost is computed as follows:

Y = \$4,800,000 + (\$0.05 per DL\$)(\$8,000,000)

Estimated fixed overhead	\$4,800,000
Estimated variable overhead: \$0.05 per DL\$ ×	
\$8,000,000 DL\$	400,000
Estimated total overhead cost	\$5,200,000

The predetermined overhead rate is computed as follows:

Estimated total overhead (a)	\$5,200,000	
Estimated total direct labor-dollars (b)	8,000,000	DL\$
Predetermined overhead rate (a) ÷ (b)	\$0.65	per DL\$

2. Total cost assigned to You Can Say That Again:

Direct materials	\$1,259,000
Direct labor	2,400,000
Overhead applied ($\$0.65$ per DL $\$ \times \$2,400,000$)	<u>1,560,000</u>
Total job cost	\$5,219,000

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-15 (45 minutes)

1a. The first step is to calculate the estimated total overhead costs in Molding and Fabrication:

Molding: Using the equation Y = a + bX, the estimated total manufacturing overhead cost would be calculated as follows:

$$Y = $700,000 + ($3.00 per MH)(20,000 MHs)$$

Estimated fixed manufacturing overhead	\$700,000
Estimated variable manufacturing overhead: \$3.00	
per MH × 20,000 MHs	60,000
Estimated total manufacturing overhead cost	<u>\$760,000</u>

Fabrication: Using the equation Y = a + bX, the estimated total manufacturing overhead cost would be calculated as follows:

$$Y = $210,000 + ($1.00 per MH)(30,000 MHs)$$

Estimated fixed manufacturing overhead	\$210,000
Estimated variable manufacturing overhead: \$1.00	
per MH × 30,000 MHs	30,000
Estimated total manufacturing overhead cost	\$240,000

The second step is to combine the estimated manufacturing overhead costs in Molding and Fabrication (\$760,000 + \$240,000 = \$1,000,000) to enable calculating the predetermined overhead rate as follows:

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Estimated total manufacturing overhead (a)	\$1,000,000	
Estimated total machine-hours (b)	50,000	MHs
Predetermined overhead rate (a) ÷ (b)	\$20.00	per MH

Exercise 2-15 (continued)

1b. Total manufacturing cost assigned to Jobs D-70 and C-200:

	D-70	C-200
Direct materials	\$700,000	\$ 550,000
Direct labor	360,,000	400,000
Manufacturing overhead applied (\$20.00 per MH × 20,000 MHs; \$20.00 per MH × 30,000 MHs)	400,000	600,000
Total manufacturing cost		-
1c. Bid prices for Jobs D-70 and C-200:	0.70	C 200
	<u>D-70</u>	<u>C-200</u>
Total manufacturing cost (a)	\$ 1, 460,000	\$1,550,000
Markup percentage (b)	150%	150%
Bid price (a) × (b)	\$2,190,000	\$2,325,000
1d. Because the company has no beginning of only Jobs D-70 and C-200 were started, of the year, the cost of goods sold is equal to	completed, a	and sold during

manufacturing costs assigned to both jobs of \$3,010,000

(=\$1,460,000 + \$1,550,000).

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-15 (continued)

2a. Molding Department:

Using the equation Y = a + bX, the estimated total manufacturing overhead cost would be depicted as follows:

$$Y = $700,000 + ($3.00 per MH)(20,000 MHs)$$

Estimated fixed manufacturing overhead	\$700,000
Estimated variable manufacturing overhead: \$3.00	
per MH × 20,000 MHs	60,000
Estimated total manufacturing overhead cost	<u>\$760,000</u>

The predetermined overhead rate is computed as follows:

Estimated total manufacturing overhead (a)	\$760,000
Estimated total machine-hours (b)	20,000 MHs
Predetermined overhead rate (a) ÷ (b)	\$38.00 per MH

Fabrication Department:

Using the equation Y = a + bX, the estimated total manufacturing overhead cost would be depicted as follows:

$$Y = $210,000 + ($1.00 per MH)(30,000 MHs)$$

© The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Estimated fixed manufacturing overhead	\$210,000
Estimated variable manufacturing overhead: \$1.00	
per MH × 30,000 MHs	30,000
Estimated total manufacturing overhead cost	\$240,000

The predetermined overhead rate is computed as follows:

Estimated total manufacturing overhead (a).. \$240,000

Predetermined overhead rate (a) ÷ (b)....... \$8.00 per MH

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-15 (continued)

2b. Total manufacturing costs assigned to Jobs D-70 and C-200:

	D-70	C-200
Direct materials	700,000	\$ 550,000
Direct labor	360,000	400,000
Molding Department (14,000 MHs \times \$38 per MH; 6,000 MHs \times \$38 per MH)	532,000	228,000
Fabrication Department (6,000 MH × \$8 per MH; 24,000 MH × \$8 per MH)	48,000	192,000
Total manufacturing cost\$	1,640,000	\$1,370,000
2c. Bid prices for Jobs D-70 and C-200:		
	D-70	C-200
Total manufacturing cost (a)\$	1,,640,000	\$1,370,000
Markup percentage (b)	150%	150%
Bid price (a) × (b)\$	2,460,000	\$2,055,000
2d. Because the company has no beginning or en	nding invento	ories and

- 2d. Because the company has no beginning or ending inventories and only Jobs D-70 and C-200 were started, completed, and sold during the year, the cost of goods sold is equal to the sum of the manufacturing costs assigned to both jobs of \$3,010,000 (=\$1,640,000 + \$1,370,000).
- 3. The plantwide and departmental approaches for applying manufacturing overhead costs to products produce identical cost of goods sold figures. However, these two approaches lead to different bid prices for Jobs

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

D-70 and C-200. The bid price for Job D-70 using the departmental approach is \$270,000 (=\$2,460,000 - \$2,190,000) higher than the bid price using the plantwide approach. This is because the departmental cost pools reflect the fact that Job D-70 is an intensive user of Molding machine-hours. The overhead rate in Molding (\$38) is much higher than the overhead rate in Fabrication (\$8). Conversely, Job C-200 is an intensive user of the less-expensive Fabrication machine-hours, so its departmental bid price is \$270,000 lower than the plantwide bid price.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2-15 (continued)

Whether a job-order costing system relies on plantwide overhead cost allocation or departmental overhead cost allocation does not usually have an important impact on the accuracy of the cost of goods sold reported for the company as a whole. However, it can have a huge impact on internal decisions with respect to individual jobs, such as establishing bid prices for those jobs. Job-order costing systems that rely on plantwide overhead cost allocation are commonly used to value ending inventories and cost of goods sold for external reporting purposes, but they can create costing inaccuracies for individual jobs that adversely influence internal decision making.

Problem 2-16 (30 minutes)

1a. The estimated total overhead cost is computed as follows:

Y = \$784,000 + (\$2.00 per DLH)(140,000 DLHs)

Estimated fixed manufacturing overhead \$	784,000
Estimated variable manufacturing overhead: \$2.00	
per DLH × 140,000 DLH	280,000
Estimated total manufacturing overhead cost \$1	,064,000

The predetermined overhead rate is computed as follows:

Estimated total manufacturing overhead (a)	\$1,064,000	
Estimated total direct labor-hours (b)	140,000	DLH
Predetermined overhead rate (a) ÷ (b)	\$7.60	per DLH
1b. Total manufacturing cost assigned to Job 550):	
151 Total Manaractaring cost assigned to 305 55	.	
Direct materials		\$175
Direct labor		225
Manufacturing overhead applied (\$7.60 per DLH	×	
15 DLH)		<u>114</u>
Total manufacturing cost of Job 550		<u>\$514</u>

1c. The selling price for Job 550 is computed as follows:

Job 550

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Total manufacturing cost	\$ 514
Markup (200%)	1,028
Selling price	\$1,542

Problem 2-16 (continued)

2a. The estimated total overhead cost is computed as follows:

Y = \$784,000 + (\$4.00 per MH)(70,000 MHs)

Estimated fixed manufacturing overhead \$	784,000
Estimated variable manufacturing overhead: \$4.00	
per MH × 70,000 MHs	280,000
Estimated total manufacturing overhead cost \$1	,064,000

The predetermined overhead rate is computed as follows:

Estimated total manufacturing overhead (a) \$	1,064,000	
Estimated total machine-hours (b)	70,000	MHs
Predetermined overhead rate (a) \div (b)	\$15.20	per MH
2b. Total manufacturing cost assigned to Job 550:		
Direct materials		\$175
Direct labor		225
Manufacturing overhead applied (\$15.20 per MH × MH)		<u>76</u> \$476
10.00. 11.01.01.00.01.11.9 0000 01 000 000 1111111111		<u>¥ 17 0</u>

2c. The selling price for Job 550 is computed as follows:

Job 550

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Total manufacturing cost	\$	476
Markup (200%)	_	952
Selling price	<u>\$1</u>	<u>,428</u>

3. The price for Job 550 using direct labor-hours as the allocation base (\$1,542) is \$114 higher than the price derived using machine-hours as the allocation base (\$1,428). If machine-hours is the better choice for an allocation base, then if Landen continues to use direct labor-hours as its overhead allocation base, it will overprice jobs that are intensive users of direct labor-hours and non-intensive users of machine-hours. In a bidding situation, Landen will tend to lose bids on jobs such as Job 550 if its competitors have more accurate cost accounting systems.

Problem 2-17 (20 minutes)

1. The predetermined plantwide overhead rate is computed as follows:

Estimated manufacturing overhead (a)	\$1,400,000	
Estimated total direct labor-hours (b)	80,000	DLHs
Predetermined overhead rate (a) ÷ (b)	\$17.50	per DLH

The overhead applied to Job Bravo is computed as follows:

Direct labor-hours worked on Bravo (a)	14	
Predetermined overhead rate (b)	\$17.50	per DLH
Overhead applied to Bravo (a) \times (b)	\$245	

2. The predetermined overhead rate in Assembly is computed as follows:

Estimated manufacturing overhead (a)	\$600,000	
Estimated total direct labor-hours (b)	50,000	DLHs
Predetermined overhead rate (a) ÷ (b)	\$12.00	per DLH

The predetermined overhead rate in Fabrication is computed as follows:

Estimated manufacturing overhead (a)	\$800,000	
Estimated total machine-hours (b)	100,000	MHs
Predetermined overhead rate (a) ÷ (b)	\$8.00	per MH

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

The overhead applied to Job Bravo is computed as follows:

	Assembly	Fabrication	Total
Quantity of allocation base used (a)	11	6	
Predetermined overhead rate (b)	\$12.00	\$8.00	
Overhead applied to Bravo (a) \times (b)	\$132	\$48	\$180

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2-18 (15 minutes)

1. The estimated total overhead cost is computed as follows:

Y = \$350,000 + (\$1.00 per DLH)(20,000 DLHs)

Estimated fixed overhead	\$350,000
Estimated variable overhead: \$1.00 per DLH ×	
20,000 DLHs	<u>20,000</u>
Estimated total overhead cost	\$370,000

The predetermined overhead rate is computed as follows:

Estimated total overhead (a)	\$370,000
Estimated total direct labor-hours (b)	20,000 DLHs
Predetermined overhead rate (a) \div (b)	\$18.50 per DLH

2. Total manufacturing cost assigned to Mr. Wilkes:

Direct materials	\$590
Direct labor	109
Overhead applied (\$18.50 per DLH \times 6 DLH)	<u>111</u>
Total cost assigned to Mr. Wilkes	<u>\$810</u>

3. The price charged to Mr. Wilkes is computed as follows:

Job 550

Total manufacturing cost...... \$ 810

© The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Markup (40%)	324
Selling price	\$1,134

Problem 2-19 (20 minutes)

1. Molding Department:

The estimated total manufacturing overhead cost in the Molding Department is computed as follows:

$$Y = $497,000 + $1.50 \text{ per MH} \times 70,000 \text{ MHs}$$

Estimated fixed manufacturing overhead	\$497,000
Estimated variable manufacturing overhead:	
\$1.50 per MH × 70,000 MHs	_105,000
Estimated total manufacturing overhead cost	\$602,000

The predetermined overhead rate is computed as follows:

Estimated total manufacturing overhead (a).	\$602,000	
Estimated total machine-hours (b)	70,000	MHs
Predetermined overhead rate (a) ÷ (b)	\$8.60	per MH

Painting Department:

The estimated total manufacturing overhead cost in the Painting Department is computed as follows:

$$Y = $615,000 + $2.00 \text{ per DLH} \times 60,000 \text{ DLHs}$$

Estimated fixed manufacturing overhead...... \$615,000

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Estimated variable manufacturing overhead:	
\$2.00 per DLH × 60,000 DLHs	120,000
Estimated total manufacturing overhead cost	<u>\$735,000</u>

The predetermined overhead rate is computed as follows:

Estimated total manufacturing overhead (a). \$735,000 Estimated total DLHs (b)........ 60,000 DLHs Predetermined overhead rate (a) \div (b)...... \$12.25 per DLH

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2-19 (continued)

 Molding Department overhead applied: 110 machine-hours × \$8.60 per machine-hour. 	\$ 946
Painting Department overhead applied: 84 direct labor-hours × \$12.25 per DLH	1,029
Total overhead cost	<u>\$1,975</u>

3. Total cost of Job 205:

	Molding		Painting	
	Dept.		Dept.	Total
Direct materials	\$	770	\$1,332	\$2,102
Direct labor		525	1,470	1,995
Manufacturing overhead applied	<u>946</u>		1,029	<u>1,975</u>
Total manufacturing cost	<u>\$2,241</u>		<u>\$3,831</u>	<u>\$6,072</u>
Unit product cost for Job 205:				
Total manufacturing cost (a)		\$6,07	' 2	
Number of units in the job (b)		5	0 units	

Unit product cost (a) ÷ (b)...... \$121.44 per unit

[@] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2-20 (45 minutes)

1a. The first step is to calculate the total estimated overhead costs in ICU and Other:

ICU: Using the equation Y = a + bX, the estimated total overhead cost would be calculated as follows:

$$Y = $3,200,000 + ($236 per patient-day)(2,000 patient-days)$$

Other: Using the equation Y = a + bX, the estimated total overhead cost would be calculated as follows:

The second step is to combine the estimated overhead costs in ICU and Other (\$3,672,000 + \$15,728,000 = \$19,400,000) to enable calculating the predetermined overhead rate as follows:

Estimated total overhead (a).....\$19,400,000

© The McGraw-Hill Companies, Inc., 2018. All rights reserved.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2-20 (continued)

1b. The total cost assign to Patients A and B is computed as follows:

	Patient A	Patient B
Direct materials	\$ 4,500	\$ 6,200
Direct labor	25,000	36,000
Overhead applied (\$970 per patient-day × 14 patient days; (\$970 per patient-		
day × 21 patient days)	<u>13,580</u>	20,370
Total cost	<u>\$43,080</u>	<u>\$62,570</u>

2a. The overhead rate in ICU is computed as follows:

Y = \$3,200,000 + (\$236 per patient-day)(2,000 patient-days)

Estimated fixed overhead.....\$3,200,000

Estimated variable overhead:

\$236 per patient-day \times 2,000 patient-days................. 472,000

Estimated total overhead cost......\$3,672,000

The predetermined overhead rate is computed as follows:

Estimated total overhead (a).....\$3,672,000

Predetermined overhead rate (a) \div (b)...... \$1,836 per patient-day

The overhead rate in Other is computed as follows:

Y = \$14,000,000 + (\$96 per patient-day)(18,000 patient-days)

© The McGraw-Hill Companies, Inc., 2018. All rights reserved.

	1 7 7
Estimated variable overhead: \$96 per patient-day × 18,000 patient-days	1,728,000
Estimated total overhead cost	\$15,728,000
The predetermined overhead rate is computed a	
The predetermined overhead rate is compated a	
Estimated total overhead (a)\$15	5,728,000

Estimated fixed overhead.....\$14,000,000

Predetermined overhead rate

Problem 2-20 (continued)

2b. The total cost assigned to Patient A:

	\$ 4,500
	25,000
\$ 0	
12,233	12,233
=	<u>\$41,733</u>
	\$ 6,200
	36,000
\$12,852	
12,233	<u>25,085</u>
=	<u>\$67,285</u>
	12,233 = \$12,852 12,233

3. Relying on just one predetermined overhead rates overlooks the fact that some departments are more intensive users of overhead resources than others. As the name implies, patients in the ICU require more intensive (and expensive) care than other patients in other departments. Broadly, speaking, relying on only one overhead rate, will most likely overcost patients with less severe illnesses and undercost patients with more severe illnesses.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2-21 (30 minutes)

1. The plantwide predetermined overhead rate is computed as follows:

Estimated manufacturing overhead (a)	\$600,000	
Estimated total direct labor-hours (b)	60,000	DLHs
Predetermined overhead rate (a) ÷ (b)	\$10	per DLH

The overhead applied to Job A is computed as follows:

Direct labor-hours worked on Job A (a)	15
Predetermined overhead rate (b)	\$10 per DLH
Overhead applied to Job A (a) \times (b)	\$150

The overhead applied to Job B is computed as follows:

Direct labor-hours worked on Job B (a)	9
Predetermined overhead rate (b)	\$10 per DLH
Overhead applied to Job B (a) \times (b)	\$90

2. The predetermined overhead rate in Machining is computed as follows:

Estimated manufacturing overhead (a)	\$500,000	
Estimated total machine-hours (b)	50,000	MHs
Predetermined overhead rate (a) ÷ (b)	\$10	per MH

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

The predetermined overhead rate in Assembly is computed as follows:

Estimated manufacturing overhead (a)	\$100,000	
Estimated total direct labor-hours (b)	50,000	DLHs
Predetermined overhead rate (a) ÷ (b)	\$2	per DLH

The overhead applied to Job A is computed as follows:

	Machining	Assembly	Total
Quantity of allocation base used (a)	11	10	
Predetermined overhead rate (b)	\$10	\$2	
Overhead applied to Job A (a) \times (b)	\$110	\$20	\$130

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2-21 (continued)

The overhead applied to Job B is computed as follows:

	Machining	Assembly	Total
Quantity of allocation base used (a)	12	5	
Predetermined overhead rate (b)	\$10	\$2	
Overhead applied to Job B (a) \times (b)	\$120	\$10	\$130

3. The plantwide approach will overcost jobs that are intensive users of Assembly and minimal users of Machining. Conversely, it will undercost products that are intensive users of Machining and minimal users of Assembly. These cost distortions will adversely impact the company's pricing process. Jobs that get overcosted will have selling prices that are greater than the prices that would be established using departmental overhead allocation. Jobs that get undercosted will have selling prices that are less than the prices that would be established using departmental overhead allocation.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Case 2-22 (60 minutes)

- 1. a. Predetermined overhead rate $= \frac{\text{Estimated total manufacturing overhead cost}}{\text{Estimated total amount of the allocation base}}$ $= \frac{\$840,000}{\$600,000 \text{ direct labor cost}} = \frac{140\% \text{ of direct labor cost}}{\$600,000 \text{ direct labor cost}}$
 - b. The manufacturing overhead cost applied to the Koopers job is computed as follows:

$$$9,500 \times 140\% = $13,300$$

2.	a.			Machining Department	,
		Estimated manufacturing overhead cost (a)	\$350,000	\$400,000	\$ 90,000
		Estimated direct labor cost (b)	\$200,000	\$100,000	\$300,000
		Predetermined overhead rate (a) ÷ (b)	175%	400%	30%
	b.	Fabricating Department:			
		\$2,800 × 175%		\$4,900	
		Machining Department:			
		\$500 × 400%		2,000	
		Assembly Department:			
		\$6,200 × 30%		<u>1,860</u>	

<u>\$8,760</u>

Total applied overhead.....

 $[\]hbox{@}$ The McGraw-Hill Companies, Inc., 2018. All rights reserved.

3. The bulk of the labor cost on the Koopers job is in the Assembly Department, which incurs very little overhead cost. The department has an overhead rate of only 30% of direct labor cost as compared to much higher rates in the other two departments. Therefore, as shown above, use of departmental overhead rates results in a relatively small amount of overhead cost being charged to the job.

Use of a plantwide overhead rate in effect redistributes overhead costs proportionately between the three departments (at 140% of direct labor

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Case 2-22 (continued)

cost) and results in a large amount of overhead cost being charged to the Koopers job, as shown in Part 1. This may explain why the company

bid too high and lost the job. Too much overhead cost was assigned to the job for the kind of work being done on the job in the plant.

On jobs that require a large amount of labor in the Fabricating or Machining Departments the opposite will be true, and the company will tend to charge too little overhead cost to the jobs if a plantwide overhead rate is being used. The reason is that the plantwide overhead rate (140%) is much lower than the rates would be if these departments were considered separately.

4. The company's bid was:

Direct materials	\$ 4,600
Direct labor	9,500
Manufacturing overhead applied (see requirement 1b)	13,300
Total manufacturing cost	\$27,400
Bidding rate	<u>× 1.5</u>
Total bid price	<u>\$41,100</u>

If departmental overhead rates had been used, the bid would have been:

Direct materials	\$ 4,600
Direct labor	9,500

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Manufacturing overhead applied (see requirement 2b)	8,760
Total manufacturing cost	\$22,860
Bidding rate	<u>× 1.5</u>
Total bid price	\$34,290

Note that if departmental overhead rates had been used, Teledex Company would have been the low bidder on the Koopers job because the competitor underbid Teledex by only \$2,000.

Appendix 2A

Activity-Based Absorption Costing

Exercise 2A-1 (20 minutes)

1. Activity rates are computed as follows:

	(a)		
	Estimated	(b)	(a) ÷ (b)
	Overhead	Expected	Activity
Activity Cost Pool	Cost	Activity	Rate
Machine setups	\$72,000	400 setups	\$180 per setup
Special processing	\$200,000	5,000 MHs	\$40 per MH
General factory	\$816,000	24,000 DLHs	\$34 per DLH

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2A-1 (continued)

2. Overhead is assigned to the two products as follows:

Hubs:

	(a)	<i>(b)</i>	(a) × (b)
Activity Cost Pool	Activity Rate	Activity	ABC Cost
Machine setups	\$180 per setup	100 setups	\$ 18,000
Special processing	\$40 per MH	5,000 MHs	200,000
General factory	\$34 per DLH	8,000 DLHs	272,000
Total			<u>\$490,000</u>
Sprockets:			
	(a)	(b)	(a) × (b)
Activity Cost Pool	Activity Rate	Activity	. , . ,
Machine setups	\$180 per setup	300 setups	\$ 54,000
Special processing	\$40 per MH	0 MHs	0
General factory	\$34 per DLH	16,000 DLHs	_544,000
Total			<u>\$598,000</u>

Exercise 2A-1 (continued)

2. Each product's unit product cost is computed as follows:

	Hubs	Sprockets
Direct materials	\$32.00	\$18.00
Direct labor:		
\$15 per DLH \times 0.80 DLHs per unit	12.00	
\$15 per DLH \times 0.40 DLHs per unit		6.00
Overhead:		
\$490,000 ÷ 10,000 units	49.00	
\$598,000 ÷ 40,000 units		14.95
Unit product cost	<u>\$93.00</u>	<u>\$38.95</u>

Exercise 2A-2 (45 minutes)

1. The unit product costs under the company's traditional costing system would be computed as follows:

	Rascon	Parcel	Total
Number of units produced (a)	20,000	80,000	
Direct labor-hours per unit (b)	0.40	0.20	
Total direct labor-hours (a) \times (b)	8,000	16,000	24,000
Total manufacturing overhead (a)	\$576,00	00	
Total direct labor-hours (b)	24,000 DLHs		
Predetermined overhead rate (a) \div (b)	\$24.00 per DLH		1
	Rascon	Parcel	
Direct materials	\$13.00	\$22.00	
Direct labor	6.00	3.00	
Manufacturing overhead applied:			
0.40 DLH per unit × \$24.00 per DLH	9.60		
0.20 DLH per unit × \$24.00 per DLH		4.80	
Unit product cost	<u>\$28.60</u>	<u>\$29.80</u>	

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2A-2 (continued)

2. The unit product costs using activity-based absorption costing can be computed as follows:

	Esti- mated		
	Overhead	(b)	(a) ÷ (b)
Activity Cost Pool	Cost*	Expected Activity	Activity Rate
Labor related	\$288,000	24,000 direct labor-hours	\$12.00 per direct labor-hour
Engineering design	\$288,000	6,000 engineering-hours	\$48.00 per engineering-hour
	<u>\$576,000</u>		

^{*}The total estimated manufacturing overhead cost of \$576,000 is split evenly between the two activity cost pools.

Manufacturing overhead is assigned to the two products as follows:

Rascon:

(a) (b) (a)
$$\times$$
 (b) Activity Cost Pool Activity Rate Activity ABC Cost

[©] The McGraw-Hill Companies, Inc., 2015. All rights reserved.

Labor related	\$12 per DLH	8,000 DLHs	\$ 96,000
Engineering design.	\$48 per engineering-hour	3,000 engineering-hours	<u> 144,000</u>
Total			<u>\$240,000</u>
Dancal			
Parcel:	(a)	(b)	(a) × (b)
Activity Cost Pool	Activity Rate	Activity	ABC Cost
Labor related	\$12 per DLH	16,000 DLHs	\$192,000
Engineering design.	\$48 per engineering-hour	3,000 engineering-hours	<u> 144,000</u>
Total			<u>\$336,000</u>

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2A-2 (continued)

The unit product costs combine direct materials, direct labor, and overhead costs:

	Rascon	Parcel
Direct materials	\$13.00	\$22.00
Direct labor	6.00	3.00
Manufacturing overhead (\$240,000 ÷ 20,000 units; \$336,000 ÷ 80,000 units)	12.00	4.20
Unit product cost	<u>\$31.00</u>	<u>\$29.20</u>

3. The unit product cost of the high-volume product, Parcel, declines under the activity-based approach, whereas the unit product cost of the low-volume product, Rascon, increases. This occurs because half of the overhead is applied on the basis of engineering design hours instead of direct labor-hours. When the overhead was applied on the basis of direct labor-hours, most of the overhead was applied to the high-volume product. However, when the overhead is applied on the basis of engineering-hours, more of the overhead cost is shifted over to the low-volume product. Engineering-hours is a product-level activity, so the higher the volume, the lower the unit cost and the lower the volume, the higher the unit cost.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2A-3 (45 minutes)

1. The predetermined overhead rate is computed as follows:

Predetermined overhead rate =
$$\frac{$325,000}{50,000 \text{ DLHs}}$$
 = \$6.50 per DLH

The unit product costs under the company's traditional costing system are computed as follows:

		Stand ard
Direct materials	\$72.00	\$53.00
Direct labor	19.00	15.20
Manufacturing overhead (1.0 DLH \times \$6.50 per DLH; 0.8 DLH \times \$6.50 per DLH)	6.50	5.20
Unit product cost	<u>\$97.50</u>	<u>\$73.40</u>

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2A-3 (continued)

2. The activity rates are computed as follows:

	(a)				
	Estimate d	(b)			
	Overhea d	Total		((a) ÷ (b)
Activity Cost Pool	Cost	Expected Act	tivity	Ac	tivity Rate
Supporting direct labor	\$200,000	50,000 DI	LHs	\$4	per DLH
Batch setups	\$75,000	300 se	etups s	\$250	per setup
Safety testing	\$50,000	100 te	sts s	\$500	per test

Manufacturing overhead is assigned to the two products as follows:

Deluxe Product:

Batch setups	\$250 per setup	200 setups	50,000
Safety testing	\$500 per test	30 tests	15,000
Total			<u>\$105,000</u>
Standard Product:			
	(a)	<i>(b)</i>	(a) × (b)
Activity Cost Pool	Activity Rate	Activity	ABC Cost
Supporting direct labor	\$4 per DLH	40,000 DLHs	\$160,000
Batch setups	\$250 per setup	100 setups	25,000
Safety testing	\$500 per test	70 tests	35,000
Total			<u>\$220,000</u>

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2A-3 (continued)

Activity-based absorption costing unit product costs are computed as follows:

	Deluxe	Standard
Direct materials	\$ 72.00	\$53.00
Direct labor	19.00	15.20
Manufacturing overhead (\$105,000 ÷ 10,000 units; \$220,000 ÷ 50,000 units)	10.50	<u>4.40</u>
Unit product cost	<u>\$101.50</u>	<u>\$72.60</u>

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2A-4 (60 minutes)

1. a. When direct labor-hours are used to apply overhead cost to products, the company's predetermined overhead rate would be:

Predetermined overhead rate =
$$\frac{\text{Manufacturing overhead cost}}{\text{Direct labor-hours}}$$
$$= \frac{\$1,800,000}{36,000\text{DLHs}} = \$50 \text{ per DLH}$$

b.		Mod	del .
	-	X200	X99
	Direct materials	\$ 72	\$ 50
	Direct labor: $\$20$ per hour \times 1.8 hours and 0.9 hours	36	18
	Manufacturing overhead: \$50 per hour × 1.8 hours and 0.9 hours	90	<u>45</u>
	Total unit product cost	<u>\$198</u>	<u>\$113</u>

2. a. Predetermined overhead rates for the activity cost pools:

	(a) Estimated	(b) Estimated	
Activity Cost Pool	Total Cost	Total Activity	(a) ÷ (b) Activity Rate
Machine setups	\$360,000	150 setups	\$2,400 per setup
Special processing	\$180,000	12,000 MHs	\$15 per MH
General factory	\$1,260,000	36,000 DLHs	\$35 per DLH

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2A-4 (continued)

The overhead applied to each product can be determined as follows:

Model X200

	Activity Cost Pool	(a) Activity Rate	(b) Activity	(a) × (b) ABC Cost
M	achine setups\$	2,400 per setup	50 setups	\$120,000
Sp	pecial processing	\$15 per MH	12,000 MHs	180,000
G	eneral factory	\$35 per DLH	9,000 DLHs	315,000
To	otal manufacturing overhead cost (a)			<u>\$615,000</u>
N	umber of units produced (b)			5,000
0	verhead cost per unit (a) ÷ (b)			<u>\$123.00</u>

Model X99

Activity Cost Pool	(a) Activity Rate	(b) Activity	(a) × (b) ABC Cost
Machine setups	,	,	\$ 240,000
Special processing	\$15 per MH	0 MHs	0

[@] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

General factory	\$35 per DLH	27,000 DLHs	<u>945,000</u>
Total manufacturing overhead cost (a)			\$1,185,000
Number of units produced (b)			30,000
Overhead cost per unit (a) ÷ (b)			<u>\$39.50</u>

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2A-4 (continued)

b. The unit product cost of each model under the activity-based approach would be computed as follows:

	Model	
	X200	X99
Direct materials	\$ 72.00	\$50.00
Direct labor: \$20 per DLH × 1.8 DLHs, 0.9 DLHs	36.00	18.00
Manufacturing overhead (above)	123.00	39.50
Total unit product cost	<u>\$231.00</u>	<u>\$107.50</u>

Comparing these unit cost figures with the unit costs in Part 1(b), we find that the unit product cost for Model X200 has increased from \$198 to \$231, and the unit product cost for Model X99 has decreased from \$113 to \$107.50.

3. It is especially important to note that, even under activity-based costing, 70% of the company's overhead costs continue to be applied to products on the basis of direct labor-hours:

Machine setups (number of setups)	\$ 360,000	20%
Special processing (machine-hours)	180,000	10
General factory (direct labor-hours)	1,260,000	<u>70</u>
Total overhead cost	<u>\$1,800,000</u>	<u>100</u> %

Thus, the shift in overhead cost from the high-volume product (Model X99) to the low-volume product (Model X200) occurred as a result of reassigning only 30% (=20% + 10%) of the company's overhead costs.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

The increase in unit product cost for Model X200 can be explained as follows: First, where possible, overhead costs have been traced to the products rather than being lumped together and spread uniformly over production. Therefore, the special processing costs, which are traceable to Model X200, have all been assigned to Model X200 and none assigned to Model X99 under the activity-based approach. It is common in industry to have some products that require special handling or special processing of some type. This is especially true in modern factories that produce a variety of products. Activity-based costing provides a vehicle for assigning these costs to the appropriate products.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2A-4 (continued)

Second, the costs associated with the batch-level activity (machine setups) have also been assigned to the specific products to which they relate. These costs have been assigned according to the number of setups completed for each product. However, because a batch-level activity is involved, another factor affecting unit costs comes into play. That factor is batch size. Some products are produced in large batches and some are produced in small batches. *The smaller the batch, the higher the per unit cost of the batch activity.* In the case at hand, the data can be analyzed as follows:

Model X200:

Cost to complete one setup (see requirement 2a)	\$2,400	(a)
Number of units processed per setup (5,000 units per setup ÷ 50 setups = 100 units)	100 units	(b)
Setup cost per unit (a) ÷ (b)	\$24	
Model X99:		
Cost to complete one setup (see requirement 2a)	\$2,400	(a)
Number of units processed per setup (30,000 units per setup ÷ 100 setups = 300 units)	300 units	(b)
Setup cost per unit (a) ÷ (b)	\$8	

Thus, the cost per unit for setups is three times as great for Model X200, the low-volume product, as it is for Model X99, the high-volume product. Such differences in cost are obscured when direct labor-hours (or any other volume measure) is used as a basis for applying overhead cost to products.

In sum, overhead cost has shifted from the high-volume product to the low-volume product as a result of more appropriately assigning some © The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2A-5 (60 minutes)

1. The company's estimated direct labor-hours can be computed as follows:

Deluxe model: 5,000 units \times 2 DLHs per unit.... 10,000 DLHs Regular model: 40,000 units \times 1 DLH per unit... 40,000 DLHs Total direct labor hours...... 50,000 DLHs

Using just direct labor-hours as the base, the predetermined overhead rate would be:

 $\frac{\text{Estimated overhead cost}}{\text{Estimated direct labor-hours}} = \frac{\$900,000}{50,000\text{DLHs}} = \18 per DLH

The unit product cost of each model using the company's traditional costing system would be:

	Deluxe	Regular
Direct materials	\$ 40	\$25
Direct labor	38	19
Manufacturing overhead:		
\$18 per DLH × 2 DLHs	36	
\$18 per DLH × 1 DLH		<u>18</u>
Total unit product cost	<u>\$114</u>	<u>\$62</u>

2. Predetermined overhead rates are computed below:

(a) (a) ÷ (b)
Activity Cost Pool Estimated (b) Activity Rate

Overhead Expected

© The McGraw-Hill Companies, Inc., 2018. All rights reserved.

	Cost	Activity	
Purchasing	\$204,000	600 purchase or- ders	- \$340 per purchase order
Processing	\$182,000	35,000 machine- hours	•
Scrap/rework	\$379,000	2,000 orders	\$189.50 per order
Shippina	\$135,000	900 shipments	\$150 per shipment

Problem 2A-5 (continued)

3. a. The overhead applied to each product can be determined as follows:

The Deluxe Model

Activity Cost Pool	(a) Activity Rate	(b) Activity	(a) × (b) ABC Cost
Activity Cost 1 ooi	Activity Nate	Activity	ADC COSt
Purchasing	\$340 per PO	200 POs	\$ 68,000
Processing	\$5.20 per MH	20,000 MHs	104,000
Scrap/rework	\$189.50 per order	1,000 tests	189,500
Shipping	\$150 per shipment	250 shipments	<u>37,500</u>
Total overhead cost (a)			<u>\$399,000</u>
Number of units produced (b)			5,000
Overhead cost per unit (a) \div (b).			<u>\$79.80</u>
The Regular Model			
Activity Cost Pool	(a) Activity Rate	(b) Activity	(a) × (b) ABC Cost
Purchasing	\$340 per PO	400 POs	\$136,000

Processing	\$5.20 per MH	15,000 MHs	78,000
Scrap/rework	\$189.50 per order	1,000 orders	189,500
Shipping	\$150 per shipment	650 shipments	97,500
Total overhead cost (a)			<u>\$501,000</u>
Number of units produced (b)			40,000
Overhead cost per unit (a) \div (b).			<u>\$12.53</u>

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2A-5 (continued)

b. Using activity-based absorption costing, the unit product cost of each model would be:

	Deluxe	Regular
Direct materials	\$ 40.00	\$25.00
Direct labor	38.00	19.00
Manufacturing overhead (above).	<u>79.80</u>	12.53
Total unit product cost	<u>\$157.80</u>	<u>\$56.53</u>

4. Unit costs appear to be distorted as a result of using direct labor-hours as the base for assigning overhead cost to products. Although the deluxe model requires twice as much labor time as the regular model, it still is not being assigned enough overhead cost, as shown in the analysis in part 3(a).

When the company's overhead costs are analyzed on an activities basis, it appears that the deluxe model is more expensive to manufacture than the company realizes. Note that the deluxe model accounts for a majority of the machine-hours worked, even though it accounts for only 20% (= 10,000 DLHs ÷ 50,000 DLHs) of the company's direct laborhours. Also, it requires just as many scrap/rework orders as the regular model, and scrap/rework orders are very costly to the company.

When activity-based absorption costing is used and the company's transactions are analyzed by product, the overhead cost increases for the deluxe model from \$36.00 per unit to \$79.80 per unit. This suggests that less than half the overhead cost is being assigned to the deluxe model that ought to be assigned, and unit costs for the deluxe model are understated. If these costs are being used as a basis for pricing, then the selling price for the deluxe model may be too low. This may be

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Case 2A-6 (90 minutes)

1. a. The predetermined overhead rate would be computed as follows:

$$\frac{\text{Expected manufacturing overhead cost}}{\text{Estimated direct labor-hours}} = \frac{\$2,200,000}{50,000 \text{ DLHs}}$$
$$= \$44 \text{ per DLH}$$

b. The unit product cost per pound, using the company's present costing system, would be:

	Kenya Dark	Viet Select
Direct materials (given)	\$4.50	\$2.90
Direct labor (given)	0.34	0.34
Manufacturing overhead: 0.02 DLH × \$44 per DLH	0.88	0.88
Total unit product cost	<u>\$5.72</u>	<u>\$4.12</u>

2. a. Overhead rates for each activity cost pool:

	(a) Estimated	(b)	
Activity Cost Pools	Overhead Costs	Expected Activity	(a) ÷ (b) Activity Rate
Purchasing	\$560,000	2,000 orders	\$280 per order
Material handling	\$193,000	1,000 setups	\$193 per setup
Quality control	\$90,000	500 batches	\$180 per batch
Roasting	\$1,045,000	95,000 hours	\$11 per hour
Blending	\$192,000	32,000 hours	\$6 per hour

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Packaging...... \$120,000 24,000 hours \$5 per hour

Case 2A-6 (continued)

Before we can determine the amount of overhead cost to assign to the products we must first determine the activity for each of the products in the six activity centers. The necessary computations follow:

Number of purchase orders:

Kenya Dark: 80,000 pounds \div 20,000 pounds per order = 4 orders

Viet Select: 4,000 pounds \div 500 pounds per order = 8 orders

Number of setups:

Kenya Dark: $(80,000 \text{ pounds} \div 5,000 \text{ pounds per batch}) \times 2 \text{ setups}$ per batch = 32 setups

per bateri – 32 setups

Viet Select: $(4,000 \text{ pounds} \div 500 \text{ pounds per batch}) \times 2 \text{ setups per batch} = 16 \text{ setups}$

Number of batches:

Kenya Dark: 80,000 pounds $\div 5,000$ pounds per batch = 16 batches

Viet Select: 4,000 pounds \div 500 pounds per batch = 8 batches

Roasting hours:

Kenya Dark: 1.5 hours \times (80,000 pounds \div 100 pounds) = 1,200

hours

Viet Select: 1.5 hours \times (4,000 pounds \div 100 pounds) = 60 hours

Blending hours:

Kenya Dark: 0.5 hour \times (80,000 pounds \div 100 pounds) = 400 hours

Viet Select: 0.5 hour \times (4,000 pounds \div 100 pounds) = 20 hours

Packaging hours:

Kenya Dark: 0.3 hour \times (80,000 pounds \div 100 pounds) = 240 hours

Viet Select: 0.3 hour \times (4,000 pounds \div 100 pounds) = 12 hours

 $\hbox{@}$ The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Case 2A-6 (continued)

The overhead applied to each product can be determined as follows:

Kenya Dark			
Activity Cost Pool	Activity Rate	Expected Activity	Amount
Purchasing	\$280 per order	4 orders	\$ 1,120
Material handling	\$193 per setup	32 setups	6,176
Quality control	\$180 per batch	16 batches	2,880
Roasting	\$11 per roasting hour	1,200 roasting hours	13,200
Blending	\$6 per blending hour	400 blending hours	2,400
Packaging	\$5 per packaging hour	240 packaging hours	1,200
Total			<u>\$26,976</u>
Viet Select			
Activity Cost Pool	Activity Rate	Expected Activity	Amount
Purchasing	\$280 per order	8 orders	\$2,240
Material handling	\$193 per setup	16 setups	3,088
Quality control	\$180 per batch	8 batches	1,440

Roasting	\$11 per roasting hour	60 roasting hours	660
Blending	\$6 per blending hour	20 blending hours	120
Packaging	\$5 per packaging hour	12 packaging hours	60
Total			<u>\$7,608</u>

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Case 2A-6 (continued)

b. According to the activity-based absorption costing system, the manufacturing overhead cost per pound is:

	Kenya Dark	Viet Select
Total overhead cost assigned (above) (a)	\$26,976	\$7,608
Number of pounds manufactured (b)	80,000	4,000
Cost per pound (a) ÷ (b)	\$0.34	\$1.90

c. The unit product costs according to the activity-based absorption costing system are:

	Kenya Dark	Viet Select
Direct materials (given)	\$4.50	\$2.90
Direct labor (given)	0.34	0.34
Manufacturing overhead	0.34	_1.90
Total unit product cost	<u>\$5.18</u>	<u>\$5.14</u>

3. MEMO TO THE PRESIDENT: Analysis of JSI's data shows that several activities other than direct labor drive the company's manufacturing overhead costs. These activities include purchase orders issued, number of setups for material processing, and number of batches processed. The company's present costing system, which relies on direct labor time as the sole basis for assigning overhead cost to products, significantly undercosts low-volume products, such as the Viet Select coffee, and significantly overcosts high-volume products, such as our Kenya Dark coffee.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

An implication of the activity-based approach is that our low-volume products may not be covering the costs of the manufacturing resources they use. For example, Viet Select coffee is currently priced at \$5.15 per pound (\$4.12 plus 25% markup), which is only one cent higher than its activity-based cost of \$5.14 per pound. Under our present costing and pricing system, our high-volume products, such as our Kenya Dark coffee, may be subsidizing our low-volume products. Some adjustments in prices may be required.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Case 2A-6 (continued)

ALTERNATIVE SOLUTION:

Most students will compute the manufacturing overhead cost per pound of the two coffees as shown above. However, the per pound cost can also be computed as shown below. *This alternative approach provides additional insight into the data and facilitates emphasis of some points made in the chapter.*

	Kenya Dark		Viet Select	
-	Total	Per Pound (÷ 80,000)	Total	Per Pound (÷ 4,000)
Purchasing	\$ 1,120	\$0.014	\$2,240	\$0.560
Material handling	6,176	0.077	3,088	0.772
Quality control	2,880	0.036	1,440	0.360
Roasting	13,200	0.165	660	0.165
Blending	2,400	0.030	120	0.030
Packaging	1,200	0.015	60	0.015
Total	<u>\$26,976</u>	<u>\$0.337</u>	<u>\$7,608</u>	<u>\$1.902</u>

Note particularly how batch size impacts unit cost data. For example, the cost to the company to process a purchase order is \$280, regardless of how many pounds of coffee are contained in the order. Twenty thousand pounds of the Kenya Dark coffee are purchased per order (with four orders per year), and just 500 pounds of the Viet Select coffee are purchased per order (with eight orders per year). Thus, the purchase order cost *per pound* for the Kenya Dark coffee is just 1.4 cents, whereas the purchase order cost *per pound* for the Viet Select coffee is 40 times as much, or 56 cents. As stated in the text, this is one reason why unit costs of low-

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

volume products, such as the Viet Select coffee, increase so dramatically when activity-based costing is used.

Appendix 2B

The Predetermined Overhead Rate and Capacity

Exercise 2B-1 (20 minutes)

1. There were no beginning or ending inventories, so all of the jobs were started, finished, and sold during the month. Therefore cost of goods sold equals the total manufacturing cost. We can verify that by computing the cost of goods sold as shown below:

Manufacturing costs charged to jobs:

\$ 5,350
8,860
12,300
26,510
0
26,510
0
<u>\$26,510</u>
\$ 0
26,510
26,510
0

At the end of the month, the cost of unused capacity is computed as shown below:

Amount of the allocation base at capacity (a)	180.hours
Actual amount of the allocation base (b)	150.haurs
Unused capacity in hours (a) – (b)	30.hours
Unused capacity in hours (a)	30.haurs
Predetermined overhead rate (b)\$	32 per hour
Cost of unused capacity (a) × (b)	\$2,460

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2B-1 (continued)

Consequently, the income statement, prepared for internal management purposes, would appear as follows:

Wixis Cabinets Income Statement

Sales		\$43,740
Cost of goods sold (see above)		<u> 26,510</u>
Gross margin		17,230
Other expenses:		
Cost of unused capacity	\$2,460	
Selling and administrative expenses	<u>8,180</u>	10,640
Net operating income		\$ 6,590

2. When the predetermined overhead rate is based on capacity, unused capacity costs ordinarily arise because manufacturing overhead usually contains significant amounts of fixed costs. Suppose, for example, that manufacturing overhead includes \$10,000 of fixed costs and the capacity is 100 hours. Then the portion of the predetermined overhead rate that represents fixed costs is \$10,000 divided by 100 hours or \$100 per hour. Because the plant is seldom (if ever) operated beyond capacity, less than \$10,000 will ordinarily be applied to jobs. In other words, \$100 per hour multiplied by something less than 100 hours always yields less than \$10,000. Therefore, unused capacity costs will arise.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Exercise 2B-2 (30 minutes)

1. The overhead applied to Mrs. Brinksi's account would be computed as follows:

	Last Year	This Year
Estimated overhead cost (a)	\$310,500	\$310,500
Estimated professional staff hours (b)	4,600	4,500
Predetermined overhead rate (a) ÷ (b)	\$67.50	\$69.00
Professional staff hours charged to Ms. Brinksi's account	× 2.5	<u>× 2.5</u>
Overhead applied to Ms. Brinksi's account	<u>\$168.75</u>	<u>\$172.50</u>

2. If the actual overhead cost and the actual professional hours charged turn out to be exactly as estimated there would be no cost of unused capacity.

	Last Year	This Year
Predetermined overhead rate (see above)	\$67.50	\$69.00
Actual professional staff hours charged to clients' accounts (by assumption)	× 4,600	× 4,500
Overhead applied	\$310,500	\$310,500
Actual overhead cost incurred (by assumption)	310,500	310,500
Cost of unused capacity	<u>\$ 0</u>	<u>\$</u> 0

3. If the predetermined overhead rate is based on the professional staff hours available, the computations would be:

	Last Year	This Year
Estimated overhead cost (a)	\$310,500	\$310,500
The McCray Hill Companies Inc. 2010 All rights recomed		

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Professional staff hours available (b)	6,000	6,000
Predetermined overhead rate (a) ÷ (b)	\$51.75	\$51.75
Professional staff hours charged to Ms. Brinksi's account	<u>× 2.5</u>	<u>× 2.5</u>
Overhead applied to Ms. Brinksi's account	\$129.38	\$129.38

Exercise 2B-2 (continued)

4. If the actual overhead cost and the actual professional staff hours charged to clients' accounts turn out to be exactly as estimated, the cost of unused capacity would be calculated as shown below.

	Last Year	This Year
Amount of the allocation base at capacity (a)	6,000	6,000
Actual amount of the allocation base (b)	4,600	4,500
Unused capacity in hours (a) – (b)	1,400	1,500
Unused capacity in hours (a)	1,400	1,500
Predetermined overhead rate (b)	\$51.75	\$51.75
Cost of unused capacity (a) × (b)	\$72,450	\$77,625

Proponents of this method of computing predetermined overhead rates suggest that the cost of unused capacity should be treated as a period expense that is disclosed separately on the income statement.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2B-3 (60 minutes)

1. The overhead applied to the Verde Baja job is computed as follows:

	Last Year	This Year
Estimated studio overhead cost (a)	\$160,000	\$160,000
Estimated hours of studio service (b)	1,000	800
Predetermined overhead rate (a) \div (b)	\$160	\$200
Verde Baja job's studio hours	<u>× 40</u>	_× 40
Overhead applied to the Verde Baja job	<u>\$6,400</u>	<u>\$8,000</u>

2. If the predetermined overhead rate is based on the hours of studio service at capacity, the computations would be:

	Last Year	This Year
Estimated studio overhead cost at capacity (a).	\$160,000	\$160,000
Hours of studio service at capacity (b)	1,600	1,600
Predetermined overhead rate (a) \div (b)	\$100	\$100
Verde Baja job's studio hours	_× 40	<u>× 40</u>
Overhead applied to the Verde Baja job	<u>\$4,000</u>	<u>\$4,000</u>

3. The cost of unused capacity for both years is computed as follows:

	Last Year	This Year
Amount of the allocation base at capacity (a)	1,600	1,600
Actual amount of the allocation base (b)	750	500
© The McGraw-Hill Companies, Inc., 2018. All rights reserved.		

Unused capacity in hours (a) – (b)	850	1,100
Unused capacity in hours (a)	850	1,100
Predetermined overhead rate (b)	\$100	\$100
Cost of unused capacity (a) × (b)	\$85,000	\$110,000

Proponents of this method suggest that the cost of unused capacity should be treated as a period expense that is disclosed separately on the income statement.

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

Problem 2B-3 (continued)

4. Platinum Track's fundamental problem is the competition that is drawing customers away. The competition is able to offer the latest equipment, excellent service, and attractive prices. The company must do something to counter this threat or it will ultimately face failure.

Under the conventional approach in which the predetermined overhead rate is based on the estimated studio hours, the apparent cost of the Verde Baja job has increased between last year and this year. That happens because the company is losing business to competitors and therefore the company's fixed overhead costs are being spread over a smaller base. This results in costs that seem to increase as the volume declines. Under this method, Platinum Track's managers may be misled into thinking that the problem is rising costs and they may be tempted to raise prices to recover their apparently increasing costs. This would almost surely accelerate the company's decline.

Under the alternative approach, the overhead cost of the Verde Baja job is stable at \$4,000 and lower than the costs reported under the conventional method. Under the conventional method, managers may be misled into thinking that they are actually losing money on the Verde Baja job and they might refuse such jobs in the future—another sure road to disaster. This is much less likely to happen if the lower cost of \$4,000 is reported. It is true that the cost of unused capacity under the alternative approach is much larger than under the conventional approach and is growing. However, if it is properly labeled as the cost of unused capacity, management is much more likely to draw the appropriate conclusion that the real problem is the loss of business (and therefore more idle capacity) rather than an increase in costs.

While basing the predetermined rate on capacity rather than on estimated activity will not solve the company's basic problems, at least this method is less likely to send managers misleading signals.

2,700,000

\$ 300,000

Gross margin	3,750,000
Other expenses:	
Cost of unused capacity [(200,000 units – 160,000 units) × \$20 per unit]	800,000
Selling and administrative expenses	2,700,000
Net operating income	\$ 250,000

Case 2B-4 (continued)

2. Under the traditional approach, all of the company's fixed manufacturing overhead must be included in either cost of goods sold (in the income statement) or ending inventory (in the balance sheet) at the end of an accounting period. For each additional unit produced but not sold, it enables the company to include an extra \$25 of fixed overhead in ending inventory, which in turn lowers the company's cost of goods sold by \$25.

Since the company has net operating income of \$300,000 when it produces 160,000 units and sells 150,000 units, it needs to produce enough additional units, beyond 160,000 units, to raise net operating by \$200,000 to achieve a desired profit of \$500,000. The following computations show that the company would need to produce 8,000 more units (or 168,000 units in total) to achieve net operating income of \$500,000.

Additional net operating income required to attain target net operating income (\$500,000 – \$300,000) (a)	\$200,000
Fixed overhead applied to each unit of additional inventory (b)	\$25 per unit
Additional output required to attain target net operating income (a) ÷ (b)	8,000 units
Estimated number of units produced	<u>160,000</u> units
Actual number of units to be produced	<u>168,000</u> units

^{*} Although overapplied overhead is not explored in detail until the next chapter, astute students may be curious to know that this answer of 168,000 units assumes that the overapplied overhead of \$200,000 is closed entirely to Cost of Goods Sold.

Case 2B-4 (continued)

3. Under the new approach, all of the company's fixed manufacturing overhead must be included in either cost of goods sold (in the income statement), ending inventory (in the balance sheet), or cost of unused capacity (in the income statement) at the end of an accounting period. For each additional unit produced but not sold, it enables the company to include an extra \$20 of fixed overhead in ending inventory, which in turn lowers the company's cost of unused capacity by \$20.

Since the company has net operating income of \$250,000 when it produces 160,000 units and sells 150,000 units, it needs to produce enough additional units, beyond 160,000 units, to raise net operating by \$250,000 to achieve a desired profit of \$500,000. The computations below show that the company would need to produce 12,500 more units (or 172,500 units in total) to achieve net operating income of \$500,000.

net operating income (\$500,000 – \$250,000) (a)	\$250,000
Fixed overhead applied to each unit of additional inventory (b)	\$20 per unit
Additional output required to attain target net operating income (a) ÷ (b)	12,500 units
Estimated number of units produced	<u>160,000</u> units
Actual number of units to be produced	<u>172,500</u> units

4. Net operating income is more volatile under the new method than under the old method. The reason for this is that the reported profit per unit

[©] The McGraw-Hill Companies, Inc., 2018. All rights reserved.

sold is higher under the new method by \$5, the difference in the predetermined overhead rates. As a consequence, swings in sales in either direction will have a more dramatic impact on reported profits under the new method.

Case 2B-4 (continued)

- 5. The "hat trick" is a bit harder to perform under the new method. Under the old method, the target net operating income can be attained by producing an additional 8,000 units. Under the new method, the production would have to be increased by 12,500 units. Again, this is a consequence of the difference in predetermined overhead rates. The drop in sales has had a more dramatic effect on net operating income under the new method as noted above in part (4). In addition, because the predetermined overhead rate is lower under the new method, producing excess inventories has less of an effect per unit on net operating income than under the traditional method and hence more excess production is required.
- 6. One can argue that whether the "hat trick" is unethical depends on the level of sophistication of the owners of the company and others who read the financial statements. If they understand the effects of excess production on net operating income and are not misled, it can be argued that the hat trick is not unethical. However, if that were the case, there does not seem to be any reason to use the hat trick. Why would the owners want to tie up working capital in inventories just to artificially attain a target net operating income for the period? And increasing the rate of production toward the end of the year is likely to increase overhead costs due to overtime and other costs. Building up inventories all at once is very likely to be much more expensive than increasing the rate of production uniformly throughout the year. In this case, we assumed that there would not be an increase in overhead costs due to the additional production, but that is likely not to be true.

In our opinion, the hat trick is unethical unless there is a good reason for increasing production other than to artificially boost the current period's net operating income. It is certainly unethical if the purpose is to fool users of financial reports such as owners and creditors or if the purpose is to meet targets so that bonuses will be paid to top managers.
