- 2.11 a.) Draw the stress-strain diagram.
 b.) Determine the secant modulus and initial modulus.
 c.) Calculate E_c using ACI formula and compare results.
 Area of 6 in. diameter cylinder = 28.274 in.². Stress = load / area

Solution:

Maximum f'_c = 3820 psi at a strain = 0.003.

a.) See figure 2.1

b.) Secant modulus (at $f'_c/2 = 1910$ psi)

$$E_c = 1910 / 6.10 \times 10^{-4} = 3130 \text{ ksi}$$

$$\text{Approximate Initial Modulus} = 2.6(\text{ksi}) / 5.45 \times 10^{-4} = 4771 \text{ ksi}$$

(Possible range 4600 – 5200)

c.) E_c (ACI formula) = $57000\sqrt{f'_c} = 57000\sqrt{3820} = 3523 \text{ ksi}$.

Approximately percentage change from test = $(3523 - 3130) / 3523 = 11.15\%$ (from secant modulus).

2.12 Calculate shrinkage strain, creep compliance, and creep coefficient for a 6x12 in. steam-cured concrete cylinder with cement type III and the following properties. Use ACI 209R-92

Given:

H	90	%
$h_e =$		
$2V/S$	6	in.
f_{cm28}	4021	psi
w	345	lb/yd ³
w/c	0.4	
a/c	3.25	
t	400	days
t_0	28	days
t_c	1	days
γ	146	lb/ft ³

Solution:

Shrinkage Calculation

$$\varepsilon_{sh}(t, t_c) = \frac{t - t_c}{f + (t - t_c)} K_{ss} K_{sh} \varepsilon_{shu}$$

$$\varepsilon_{shu} = 780 \times 10^{-6} \frac{in.}{in.}$$

According to Table 2.5, $f = 55$

$$\frac{V}{S} = \frac{6}{2} = 3 \text{ in.}$$

$$K_{ss} = 1.17 - 0.116 \left(\frac{V}{S} \right) = 1.23 - 0.116 (3) = 0.822$$

For $H = 90\%$,

$$K_{sh} = 3.00 - 0.03H = 3.00 - 0.03 (90) = 0.30$$

$$\varepsilon_{sh}(t, t_c) = \frac{t - t_c}{f + (t - t_c)} K_{ss} K_{sh} \varepsilon_{shu}$$

$$\varepsilon_{sh}(t, t_c) = \frac{400 - 1}{55 + (400 - 1)} (0.882)(0.30)(780 \times 10^{-6}) = \mathbf{169 \times 10^{-6} \frac{in.}{in.}}$$

Creep Calculation

$$J(t, t_0) = \frac{1 + C_c(t)}{E_{cmt_0}}$$

Determination of E_{cmt_0} :

$$a = 0.70 \quad b = 0.98 \text{ (Table 2.5)}$$

$$f'_c(t_0) = f_{cm_{28}} \frac{t_0}{a + bt_0} = 4021 \frac{28}{0.70 + 0.98(28)} = 4001 \text{ psi}$$

$$E_{cmt_0} = 33 (\gamma)^{3/2} \sqrt{f'_c(t_0)} = 33 (146)^{3/2} \sqrt{4001} = 3,682,368 \text{ psi}$$

Determination of $C_c(t)$:

$$C_{cu} = 2.35$$

$$K_{ch} = 1.27 - 0.0067H = 1.27 - 0.006(90) = 0.667$$

$$K_{ca} = 1.13(t_0)^{-0.095} = 1.13(28)^{-0.095} = 0.823$$

$$K_{cs} = 1.10 - 0.068 \left(\frac{V}{S} \right) = 1.10 - 0.068(3) = 0.896$$

$$\begin{aligned} C_c(t) &= \frac{(t - t_0)^{0.60}}{10 + (t - t_0)^{0.60}} C_{cu} K_{ch} K_{ca} K_{cs} \\ &= \frac{(400 - 28)^{0.60}}{10 + (400 - 28)^{0.60}} (2.35)(0.667)(0.823)(0.896) = \mathbf{0.899} \end{aligned}$$

$$J(t, t_0) = \frac{1 + C_c(t)}{E_{cmt_0}} = \frac{1 + 0.899}{3,682,368} = \mathbf{0.516 \times 10^{-6} \text{ psi}^{-1}}$$

2.13 Calculate shrinkage strain, creep compliance, and creep coefficient for problem 2.12 using the GL 2000 Model.

Solution:

Shrinkage Calculation

Calculation of ε_{shu} :

$K = 1.15$ (Table 2.12)

$$\begin{aligned}\varepsilon_{shu} &= (900) K \left(\frac{4350}{f_{cm28}} \right)^{\frac{1}{2}} \times 10^{-6} \\ &= (900) (1.15) \left(\frac{4350}{4021} \right)^{\frac{1}{2}} \times 10^{-6} \\ &= 1076 \times 10^{-6} \frac{\text{in.}}{\text{in.}}\end{aligned}$$

Calculation of $\beta(h)$:

$$\begin{aligned}\beta(h) &= 1 - 1.18 \left(\frac{H}{100} \right)^4 \\ &= 1 - 1.18 \left(\frac{90}{100} \right)^4 \\ &= 0.226\end{aligned}$$

Calculation of $\beta(t - t_c)$:

$$\begin{aligned}\beta(t - t_c) &= \left(\frac{t - t_c}{t - t_c + 77 \left(\frac{V}{S} \right)^2} \right)^{1/2} \\ &= \left(\frac{400 - 1}{400 - 1 + 77 \left(\frac{6}{2} \right)^2} \right)^{\frac{1}{2}} \\ &= 0.604\end{aligned}$$

$$\begin{aligned}\varepsilon_s(t) &= \varepsilon_{shu} \beta(h) \beta(t - t_c) \\ &= (1076 \times 10^{-6})(0.226)(0.604) \\ &= 147 \times 10^{-6} \frac{\text{in.}}{\text{in.}}\end{aligned}$$

Creep Calculation

$$J(t, t_0) = \frac{1}{E_{cmt_0}} + \frac{\phi_{28}(t, t_0)}{E_{cm28}}$$

Calculation of E_{cmt_0} and E_{cm28} :

$$\begin{aligned}
 t_0 &= 28 \text{ days} \Rightarrow E_{cmt_0} = E_{cm28} \\
 E_{cm28} &= 500,000 + 52,000 \sqrt{f_{cm28}} \\
 &= 500,000 + 52,000 \sqrt{4021} \\
 &= 3,797,390 \text{ psi} = E_{cmt_0}
 \end{aligned}$$

Calculation of $\phi_{28}(t, t_0)$:

$$\begin{aligned}
 t_0 = 28 > t_c = 1, \text{ then } \phi(t_c) &= \left(1 - \left(\frac{t_0 - t_c}{t_0 - t_c + 77 \left(\frac{V}{S} \right)^2} \right)^{0.5} \right)^{0.5} \\
 &= \left(1 - \left(\frac{28 - 1}{28 - 1 + 77 \left(\frac{6}{2} \right)^2} \right)^{0.5} \right)^{0.5} \\
 &= 0.898
 \end{aligned}$$

$$h = \frac{H}{100} = \frac{90}{100} = 0.90$$

$$\begin{aligned}
 \phi_{28}(t, t_0) &= \phi(t_c) \left[2 \left(\frac{(t - t_0)^{0.3}}{(t - t_0)^{0.3}} \right) + \left(\frac{7}{t_0} \right)^{0.5} \left(\frac{t - t_0}{t - t_0 + 7} \right)^{0.5} \right. \\
 &\quad \left. + 2.5 (1 - 1.086 (h^2)) \left(\frac{t - t_0}{t - t_0 + 77 \left(\frac{V}{S} \right)^2} \right)^{0.5} \right] \\
 &= 0.898 \left[2 \left(\frac{(400 - 28)^{0.3}}{(400 - 28)^{0.3}} \right) + \left(\frac{7}{28} \right)^{0.5} \left(\frac{400 - 28}{400 - 28 + 7} \right)^{0.5} \right. \\

 &= \mathbf{1.137} \\
 J(t, t_0) &= \frac{1}{3,797,390} + \frac{1.137}{3,797,390} \\
 &= \mathbf{0.563 \times 10^{-6} \text{ psi}^{-1}}

Part C

The ACI 209R-92 and fib MC 2010 models both predict rapid change in creep compliance for the first few days of loading. At later loading ages the models seem to be reaching a plateau. The difference between the models is that the fib MC 2010 model predicts higher levels of creep

compliance.

- 2.16 A concrete specimen has the following properties: Humidity = 50%; $h_e = 2V/S = 51$ mm; $f_{cm28} = 16.5$ MPa; cement content (c) = 320 kg/m^3 ; $w/c = 0.59$; $a/c = 5.669$; $t_c = 28$ days; $\gamma = 2296.74 \text{ kg/m}^3$; the specimen is Type I cement; and it was moist-cured. - Predict the amount of shrinkage the concrete specimen will undergo for ages: 41; 118; 2,010; 8,988; and 10,028 days.
 - Create a graph showing the predictions versus drying duration and discuss the results

The GL 2000 model predicts higher levels of shrinkage for the concrete specimen compared to the B3 model. In addition, the B3 and GL 2000 models both reach a plateau at later drying durations.
