Essay

46. List nine advantages of a properly designed relational database.

ANSWER:

- Better information is provided.
- Data and information are shared.
- Multiple business information requirements are addressed.
- Data redundancy is minimized.
- Data consistency is applied.
- Referential integrity is enforced.
- Security is increased.
- Productivity is increased.
- Data is freed from individual applications.

POINTS: 1

RUBRIC:	<table><tr><td>Criteria</td><td>10</td><td>0</td></tr></table>	Criteria	10	0
Criteria	10	0		

Module 01 - Introduction to Database Management

	Pts	Your Score
The answer includes nine advantages, including the following or similar advantages:	1	
Better information is provided.	1	
Data and information are shared.	1	
Multiple business information requirements are addressed.	1	
Data redundancy is minimized.	1	
Data consistency is applied.	1	
Referential integrity is enforced.	1	
Security is increased.	1	
Productivity is increased.	1	
Data is freed from individual applications.	1

Module 01 - Introduction to Database Management

TIVES:

KEYWORDS: Bloom's: Remember

48. Discuss why using a relational DBMS provides better information than data stored in multiple flat files.

ANSWER: A fundamental goal of a DBMS is to turn data (recorded facts) into information (the knowledge gained by processing those facts). A flat file partitions data into several disjointed systems, lists, and files. Any request for information that involves accessing data from more than one of these areas can be difficult to fulfill, especially summarized data that helps confirm assumptions, analyze trends, and spot exceptions. In contrast, a DBMS stores data in a single file and uses related tables to make information easy to access and retrieve.

POINTS:

1

RUBRIC:

Criteria	15	0
	Pts	Your Score
The answer explains that a flat file partitions data into several disjointed systems, lists, and files.	5	
The answer also explains that with a flat file, it is difficult to fulfill requests for information that involve accessing data from more than one file, especially summarized data.	5	
In contrast, a relational DBMS stores data in a single system that uses related tables to make information easy to access and retrieve.	5
