

Three employees work for the same big-box store but have different mixes of individual mechanisms. Jimmy works in facilities. He does not mind going to work every day but feels the company should pay him more per hour. While the work is generally not stressful, Jimmy does not have much motivation to complete his daily duties quickly, so he spreads them out to fill the workday. Jimmy was trained to perform his tasks in a certain way, and he performs his job in the same manner today as he did on the first day of work.

Fatima works in door and window sales, and she enjoys not only selling but also talking about with customers. The job is not stressful, other than requiring her to stand most of the day. The store's commission motivates Fatima to sell as much as possible and to offer suggestions to most customers. However, she is not entirely sure the commission accounts are being figured correctly and has begun to personally track her sales every day. Fatima feels that each customer interaction helps her to sharpen her customer-evaluation skills, allowing her to make intuitive decisions about which items to push to which customer.

Paola works as a human resource manager and enjoys her job. She was promoted from office assistant and is thankful that she spends most of her day at her desk. Her position as manager means that she has to handle employee problems. That part of the job causes some stress to her personal skills, but she is motivated to improve her skills and do well in the job. Paola trusts her supervisor and the company as a whole but feels the company lacks in employee training, and at times she feels adrift on what tasks she is responsible for.

Given this information, which of the following statements is more likely to be true?

Fatima has the lowest chance of achieving high individual outcomes of both job performance and organizational commitment.

Fatima has the best chance of achieving high individual outcomes in both job performance and organizational commitment.

Jimmy has the best chance of achieving high individual outcomes in both job performance and organizational commitment.

Paola has the best chance of achieving high individual outcomes in both job performance and organizational commitment.

Paola has the lowest chance of achieving high individual outcomes of both job performance and organizational commitment.

Answer Key

Test name: Ch1_Organizational Behavior_2025e

B

Five individual mechanisms directly affect the individual outcomes of job performance and organizational commitment. The five factors are job satisfaction; stress; motivation; trust, justice, and ethics; and learning and decision making. Of these five factors, Fatima scores the highest in all categories. The only factor that is against Fatima's high individual outcomes is her level of trust with the commission payment system.

E

The resource-based view of organizations states that several elements make a resource valuable. One of these elements is rarity.

Essay

Student answers and examples will vary but should demonstrate understanding of the how to apply the scientific method to evaluate a problem. A sample answer follows.

Harvest Time has been in business for 15 years in the same location, a busy corner in a highly populated suburban area. The owner of the sandwich shop owns the building the shop is located in and pays only utilities, keeping the overhead low. There are only five employees—the owner and four dedicated workers. Walk-in business is brisk. The shop offers six deluxe sandwiches and one special each week, plus premade to-go soups and salads. The five workers take turns working weekends, with one weekend worked per month. Jenna, one of the workers, is surly with customers, and sales are usually lower on the weekends she works. While sales of soups and salads are down, large preorders for sandwiches are slightly higher, and the shop has developed a popular gluten-free line. Overall sales are slumping, and the owner believes Jenna is discouraging repeat customers. How would you go about evaluating this information using the scientific method? What additional information would you need and where would you get it? What is the owner's theory and resulting hypothesis?

The scientific method begins with a theory, and the owner's theory is that surly customer service discourages repeat customers and is responsible for slumping sales. When investigating this theory, you may interview employees or customers, keep notes, examine the company's ledgers, and maybe conduct a customer survey. You are looking for a relation between customer service and the likelihood a customer will return for more purchases. From there, the theory is written into a hypothesis, which predicts the relationships between the variables. The owner's hypothesis could be "Unfriendly customer service is negatively related to repeat customer sales." To test the hypothesis, you will need to examine the correlation between customer service and repeat purchases. You will want to look at causal inferences—establishing that one variable really does cause another. To do this, you must establish three things: the two variables are correlated; the presumed cause precedes the presumed effect; and no alternative explanation exists for the correlation. The verification step may require more studies to further test the theory.

B

The method of authority suggests that people hold firmly to a belief because some respected official, agency, or source has said it is so. Lupita, who often relies on this method, would most likely hire a decorator because her boss recommended them.

C

The four methods by which people know things are the methods of experience, intuition, authority, and science.

B

Personality and cultural values reflect the various traits and tendencies that describe how people act, with commonly studied traits including extraversion, conscientiousness, and collectivism.

FALSE

From a scientist's point of view, it doesn't really matter what a person's experience, intuition, or authority suggests; the prediction must be tested with data. The best way to get a feel for the correlation is to look at a scatterplot—a graph depicting the relationship between two variables.

FALSE

The integrative model also acknowledges that employees do not work alone. Instead, they typically work in one or more work teams. Like individual characteristics, these group mechanisms shape satisfaction, stress, motivation, trust, and learning.

C

The resource-based view suggests that a resource is more valuable when it is inimitable.

C

Method of Authority: People hold firmly to some belief because some respected official, agency, or source has said it is so.

E

The resource-based view suggests that a resource is more valuable when it is rare.

TRUE

The strength of the correlation can be inferred from the "compactness" of its scatterplot.

C

Making causal inferences requires establishing three things. First, that the two variables are correlated; second, that the presumed cause precedes the presumed effect in time; and third, that no alternative explanation exists for the correlation.

B

People create a history—a collective pool of experience, wisdom, and knowledge that benefits the organization. The long experience of Run Around Room in the retail market has given this company a business advantage.

E

A correlation of one indicates a perfect positive relationship.

D

The study shows only one explanation for a high turnover rate, namely the domineering attitude of a middle manager. Making causal inferences requires establishing three things. First, that the two variables are correlated; second, that the presumed cause precedes the presumed effect in time; and third, that no alternative explanation exists for the correlation.

A

Resources that are rare and inimitable are valuable to firms.

D

Effective management of OB requires a belief that several different practices are important, along with a long-term commitment to improving those practices. The Rule of One-Eighth suggests that one-half of organizations will not believe the connection between how they manage their people and the profits they earn. The CEO of Starbridge fits this category, which is the most common. The one-half of organizations that do believe in that connection will make a single change to solve their problems, not realizing that the effective management of people requires a more comprehensive and systematic approach. Of the firms that make comprehensive changes, probably about one-half will persist with their practices long enough to derive economic benefits. One-half times one-half times one-half equals one-eighth, suggesting that, at best, 12 percent of organizations will actually do what is required to build profits by putting people first.

Essay

Student answers and examples will vary but should demonstrate understanding of the group mechanisms that play a role in the integrative model. A sample answer follows.

Employees typically work in one or more work teams led by some formal (or sometimes informal) leader. Like individual characteristics, these group mechanisms shape satisfaction, stress, motivation, trust, and learning. Team characteristics and diversity describe how teams are formed, staffed, and composed and how team members come to rely on one another as they do their work. For instance, the grouping of people with diverse skills into a team so they will complement each other shows this mechanism. Team processes and communication are how teams behave, including their coordination, conflict, and cohesion. For example, a team that knows the strengths and weaknesses of its members can focus on accentuating the strengths and lessening the weaknesses to improve performance. Leader power and negotiation is all about how individuals attain authority over others. For example, people are often made the leaders of groups because of their ability to motivate others. Leader styles and behaviors capture the specific actions that leaders take to influence others at work. For instance, a leader could have an accepting attitude toward all ideas during brainstorming sessions to promote group creativity.

A

There are several behavioral attributes that have been identified as among the best and worst behaviors exhibited by coworkers. Resisting any and every form of change, even when they are beneficial, was one of the behaviors identified.

D

Trust, justice, and ethics reflect the degree to which employees feel that their company does business with fairness, honesty, and integrity. Using unethical financial reporting practices shows a lack of honesty and integrity.

TRUE

The two primary outcomes of interest to organizational behavior researchers (and employees and managers) are job performance and organizational commitment.

D

The two primary individual outcomes of interest to organizational behavior researchers: job performance and organizational commitment.

E

Method of Intuition: People hold firmly to some belief because it seems obvious or self-evident.

C

Organizational culture captures shared knowledge about the rules, norms, and values that shape employee attitudes and behaviors.

A

People also create socially complex resources such as culture, atmosphere, status, and reputation. These resources are termed "socially complex" because it's not always clear how they came to develop, although it is clear which organizations do (and do not) possess them.

A

The method of intuition refers to when people hold firmly to some belief because it seems obvious or self-evident. Because of this, you would hire more workers because it just makes sense.

B

Hypotheses are written predictions that specify relations between variables.

C

Correlations can be positive or negative and range from -1 (a perfect negative relationship) to 0 (no relationship at all) to 1 (a perfect positive relationship).

A

Resources that are rare and inimitable are valuable to organizations. People are inimitable because they create an organizational history made up of their shared knowledge, skills, and abilities; the many small decisions they make cannot be replicated by other organizations; and they create complex social resources based on shared culture, teamwork, trust, and reputation.

Essay

According to the integrative model of organizational behavior, the two individual outcomes are job performance and organizational commitment. Most employees have two primary goals for their working lives: to perform their job well and to remain a member of an organization that they respect. Most managers have two primary goals for their employees: to maximize their job performance and to ensure that they stay with the firm for a significant length of time. Student answers will vary on their thoughts about the alignment of the goals. The first goal for employees is to perform their job well, and the first goal of managers is to maximize employee performance. Those seem to be aligned, but there are several specific behaviors that could affect either side, such as the employee could be dealing with a health issue or the manager could be incompetent. The second goal of employees is to stay with an organization they respect, and the second goal of managers is to retain workers for a significant period of time. Again, these goals appear to align, but the goals depend on each other. If the company is not a company employees can respect, they are unlikely to stay employed with that company for very long, making the manager's goal unattainable.

B

Strategic management focuses on the corporate tactics and industry characteristics that affect an organization's profitability. A strategic management study can help in examining the relationship between a firm's diversification and its profitability.

FALSE

According to the resource-based view of organizations, a firm's resources also include resources related to organizational behavior, such as the knowledge, ability, and wisdom of the workforce, as well as the image, culture, and goodwill of the organization.

D

The theories and concepts found in OB are drawn from a wide variety of disciplines. Research on job performance and individual characteristics draws primarily from studies in industrial and organizational psychology.

D

Organizational culture captures "the way things are" in an organization.

B

Correlations summarize the statistical relationships between variables. Correlations can be positive or negative.

E

These resources are termed "socially complex" because it's not always clear how they came to develop.

D

The scientific method begins with theory and requires that theories be used to inspire hypotheses.

D

Yasmin is conducting a meta-analysis.

C

Method of Science: People accept some belief because scientific studies have tended to replicate that result using a series of samples, settings, and methods.

A

Talented and motivated employees are sometimes rare—witness the adage "good people are hard to find." Such people are difficult to imitate, also, and thus are inimitable. A person like Savita, who has increased productivity by 15 percent, would be difficult to imitate and thus would be considered inimitable.

B

To deal effectively with the international element of OB, companies need to be aware of the challenges and differences in dealing with foreign employees and companies based in other countries. Nancy does this by adjusting her approach with an employee from South Korea.

E

Team processes and communication summarize how teams behave, including their coordination, conflict, and cohesion.

FALSE

People also create socially complex resources, such as culture, atmosphere, status, and reputation. These resources are termed "socially complex" because it is not always clear how they came to develop, although it is clear which organizations do (and do not) possess them.

D

According to the Rule of One-Eighth, at best 12 percent of organizations will do what is required to build profits by putting people first.

TRUE

The scientific method begins with theory, defined as a collection of assertions—both written and symbolic—that specify how and why variables are related, as well as the conditions in which they should (and should not) be related.

C

The scientific method begins with theory, uses it to develop a hypothesis, then collects data, and checks whether the data verifies the hypothesis by looking for correlation.

E

Stress reflects employees' psychological responses to job demands that tax or exceed their capacities.

C

Trust, justice, and ethics reflect the degree to which employees feel that their company does business with fairness, honesty, and integrity.

FALSE

The theories and concepts found in OB are drawn from a wide variety of disciplines, such as industrial and organizational psychology, social psychology, sociology, anthropology, and economics. Models from economics are used to understand motivation, learning, and decision making. This diversity brings a unique quality to the study of OB.

B

Scientific studies are based on the scientific method originated by Sir Francis Bacon in the 1600s.

C

This ad suggests a positive correlation between hair color and fun.

B

The integrative model acknowledges that employees do not work alone. Instead, they typically work in one or more work teams, led by a formal (or sometimes an informal) leader. Because of this, you would divide your employees into three work teams, each headed by a different leader.

D

The two primary outcomes of interest to organizational behavior researchers: job performance and organizational commitment.

C

People use the method of experience to hold firmly to some belief because it is consistent with their own experience and observations. Malik's experience with the Shashin copy machine would likely convince him to buy another one.

E

Big decisions are visible to competitors and observable by industry experts. In contrast, the "behind the scenes" decisions, especially the decisions that involve the hiring and management of employees, are more invisible to competitors. Five for Five, Limited, decision to hire a new human resource manager for its Austin office would thus be invisible to competitors.

FALSE

The integrative model of OB was designed with the Rule of One-Eighth in mind.

FALSE

Meta-analysis calculates a weighted average, but larger studies receive more (not less) weight.

E

Method of Authority: People hold firmly to some belief because some respected official, agency, or source has said it is so.

Essay

Student answers and examples will vary but should demonstrate understanding of the integrative model of organizational behavior and the individual mechanisms involved. A sample answer follows.

Several individual mechanisms directly affect job performance and organizational commitment. These include job satisfaction, which captures what employees feel when thinking about their jobs and doing their day-to-day work. For example, people who complain about the lack of creativity in their jobs are expressing a low level of job satisfaction. Another individual mechanism is stress, which reflects employees' psychological responses to job demands that tax or exceed their capacities. For example, employees who become ill because of job stress reflect this mechanism. The integrative model also includes motivation, which captures the energetic forces that drive employees' work effort. For instance, an increase in pay can result in an increase in employee motivation. Trust, justice, and ethics reflect the degree to which employees feel that their company does business with fairness, honesty, and integrity. For example, if employees find out their employer supports dishonest business practices, then the employees could lose their trust in the company. The final individual mechanism shown in the model is learning and decision making, which deals with how employees gain job knowledge and how they use that knowledge to make accurate judgments on the job. For example, employers who offer job training programs deal with this mechanism.

C

Learning and decision making deals with how employees gain job knowledge and how they use that knowledge to make accurate judgments on the job.

B

Evidence-based management is a perspective that argues that scientific findings should form the foundation for management education, much as they do for medical education. Proponents of evidence-based management argue that human resources should include units that offer R&D functions for managing people. As a result, Manon would most likely hire more research and development experts for the human resource department.

D

The resource-based view suggests that the value of resources depends on several factors. It describes what exactly makes resources valuable and capable of creating long-term profits for the firm.

TRUE

If a firm has a bad enough product, people won't buy it, regardless of how happy, motivated, or committed the company's workforce is. Effective management of OB can help improve a product incrementally over the long term.

C

The integrative model examines ability, which describes the cognitive abilities (verbal, quantitative, etc.), emotional skills (other awareness, emotion regulation, etc.), and physical abilities (strength, endurance, etc.) that employees bring to a job.

A

Method of Experience: People hold firmly to some belief because it is consistent with their own experience and observations.

A

The study clearly shows that the presumed cause (walking every day) precedes the presumed effect (decreased chance of heart disease). Making causal inferences requires establishing three things. First, that the two variables are correlated; second, that the presumed cause precedes the presumed effect in time; and third, that no alternative explanation exists for the correlation.

B

When a firm expands into a new product segment, it is known as diversification.

Essay

OB is a field of study devoted to understanding, explaining, and ultimately improving the attitudes and behaviors of individuals and groups in organizations, whereas HRM uses the theories and principles studied in OB and explores the practical applications of those principles in organizations.

B

Gateway Corporation's patent on a new form of technology means the resource is inimitable, meaning that it is difficult to imitate.

FALSE

A correlation, abbreviated r , describes the statistical relationship between two variables. Correlations can be positive or negative and range from -1 (a perfect negative relationship) to 0 (no relationship at all) to 1 (a perfect positive relationship).

Essay

According to the Rule of One-Eighth, only one-half of organizations will believe the connection between how they manage their people and the profits they earn. One-half of these organizations, which see the connection, will do what other organizations have already done—try to make a single change to solve their problems, not realizing that the effective management of people requires a more comprehensive and systematic approach. Of the firms that make comprehensive changes, probably only about one-half will persist with their practices long enough to actually derive economic benefits. Thus, one-half times one-half times one-half equals one-eighth, so at best, 12 percent of organizations will do what is required to build profits by putting people first.

C

The integrative model illustrates a number of individual mechanisms that directly affect job performance and organizational commitment. These include job satisfaction, motivation, trust, justice, and ethics.

B

Job satisfaction captures what employees feel when they think about their job and doing their day-to-day work.

FALSE

Human resource management takes the theories and principles studied in OB and explores the practical applications of those principles in organizations.

A

Organizational behavior explores the attitudes and behaviors of individuals and groups in organizations.

FALSE

Research has demonstrated that national cultures affect many of the relationships in the integrative model of organizational behavior. Much of what we know about OB is not necessarily "universal" or "culture free."

A

Theory is defined as a collection of assertions that specify how and why variables are related, as well as the conditions in which they should (and should not) be related.

B

According to the resource-based view, a resource is more valuable when it is rare. As a result, if you wanted to convey your value as an employee, you would make unique, significant contributions to the company that the majority of employees could not achieve.

E

In organizational behavior research, a correlation of 1 is considered perfect. A correlation of .50 is strong, given the sheer number of things that can affect how employees feel and act..

C

Stress is the psychological response to job demands that tax or exceed an employee's capacities, as in Jamal's case. Stress is one form of an individual mechanism directly affecting job performance and organizational commitment.

E

The scientific method begins with theory and requires that theories be used to inspire hypotheses.

FALSE

Firms that undergo an IPO typically have shorter histories and need an infusion of cash to grow or introduce some new technology.

E

Human resource management takes the theories and principles studied in OB and explores the applications of those principles in organizations.

TRUE

Causal inferences means establishing that one variable really does cause another.

TRUE

Learning and decision making deal with how employees gain job knowledge and how they use that knowledge to make accurate judgments on the job.

A

A performance-based incentive system would most likely increase the motivation of employees because it would capture the energetic forces that drive employees' work effort.

A

Making causal inferences involves establishing that one variable really does cause another.

D

Leader styles and behaviors capture the specific actions that leaders take to influence others at work.

Essay

Meta-analysis takes all of the correlations found in studies of a particular relationship and calculates a weighted average (such that correlations based on studies with large samples are weighted more than correlations based on studies with small samples). Meta-analyses can form the foundation for evidence-based management—a perspective that argues that scientific findings should form the foundation for management education, much as they do for medical education.

A

Method of Intuition: People hold firmly to some belief because it seems obvious or self-evident.

E

Meta-analysis takes all the correlations found in studies of a particular relationship and calculates a weighted average of them.

C

The theories and concepts found in OB are drawn from a wide variety of disciplines. Research on satisfaction, emotions, and team processes draws heavily from social psychology.

TRUE

Strategic management focuses on the corporate tactics and industry characteristics that affect an organization's profitability. A strategic management study might examine the relationship between firm diversification (when a firm expands into a new product segment) and firm profitability.

B

The scientific method begins with a theory, defined as assertions. Because of this, you would first assert that cold weather makes people buy more jeans. This would be your theory, which would start the scientific method.

D

A correlation of zero indicates no relationship at all.

Essay

Correlation is a method used to identify the statistical relationship between two variables. A

correlation, abbreviated r , describes the statistical relationship between two variables.

Correlations can be positive or negative and range from -1 (a perfect negative relationship) to 0 (no relationship at all) to 1 (a perfect positive relationship).

A

Team characteristics and diversity describe how teams are formed, staffed, and composed and how team members come to rely on one another as they do their work.

TRUE

There is no one thing that in and of itself can increase profitability. Instead, the effective management of OB requires a belief that several different practices are important, along with a long-term commitment to improving those practices.

FALSE

Understanding the correlation is important because OB questions are not "yes or no" in nature. That is, the question is not "Does social recognition lead to higher job performance?" but rather "To what degree does social recognition lead to higher job performance?" The correlation provides a number that expresses an answer to the "to what degree" question.

Essay

Student answers and examples will vary but should demonstrate understanding of the four ways of knowing things. A sample answer follows.

The four ways are method of experience, method of intuition, method of authority, and method of science. The method of experience involves people holding firmly to a belief because it is consistent with their experience. For example, a person might never eat at a restaurant chain because of a bad experience with one of these restaurants. People use the method of intuition if they make a choice because it seems obvious. For example, a person might buy a certain cell phone because most people seem to buy it. With the method of authority, people hold a belief because some respected agency, official, or source has said that it is so. For example, a person might not see a movie because a trusted critic panned the film. The method of science involves people holding a belief because of scientific studies. For instance, a person might think that a certain region holds oil because of extensive geological studies of this region. The method of science provides the soundest explanation and most compelling support for arguments, provided the predictions are tested with data.

E

Meta-analyses involve the use of several studies, each using different kinds of samples and measures.

C

Organizational behavior (OB) is a field of study devoted to understanding, explaining, and ultimately improving the attitudes and behaviors of individuals and groups in organizations. OB can be contrasted with two other courses: human resource management and strategic management.

B

Talented and motivated employees are sometimes rare—witness the adage "good people are hard to find." Such people are difficult to imitate, also, and thus are inimitable. A person like Savita, who has increased productivity by 15 percent, would be difficult to imitate and thus would be considered inimitable.

E

Organizational structure is the organizational mechanism in the integrative model that dictates how the units within the firm link to other units.

Essay

Downside Up has a top team of engineers who have designed and produced a new software system. The software has taken the market by storm, and consumers and competitors alike are amazed that this product was not available sooner. The team of six engineers is composed of four members who have worked together for fifteen years at two different companies and two new recruits with fresh insight and enthusiasm. Downside Up has been in business for 32 years, but this is their first big product breakthrough. The company is well-positioned on the retail learning curve as the leader in the software market. Downside Up has a dedicated executive team, two of which are the children of the founder of the company. The executive team works well together with little infighting. The bulk of the employees at Downside Up work on the sales floor, and most have remained with the company for several years. Downside Up provides good benefits and has a healthy retirement plan in place. The work itself is carried out in cohesive units, where members exhibit teamwork and trust. The overall culture at Downside Up is one of inclusion, and the company and its executives have fine reputations within the industry and community.

HC Solutions was founded three years ago and has developed a new, less invasive process for monitoring blood glucose levels. The company patented the process and is currently the only company providing the service. The team that developed the process consists of five members who had all previously worked at various other companies. Though the team had never worked together, they quickly developed an atmosphere of trust and teamwork. The process was developed using all team member's insights and was built incrementally into the process it is today. The other employees at HC Solutions also work in teams on various other health-related products. None of the teams has the same cohesion as the blood glucose team, and most show signs of infighting. There is some resentment from employees outside the blood glucose team about being excluded. Executives at the company would like to replicate the blood glucose team's cohesion and culture into the rest of the company but are unsure where to start or if it is even possible.

Using the resource-based view of organizations, which company has the most valuable resources and is capable of creating long-term profits for the company? Assume both companies have equally valuable financial resources, including revenue and equity, and equally valuable physical resources, such as buildings, machines, and technology. Provide your reasons for your choice.

Student answers and examples will vary but should demonstrate understanding of how people can be valuable resources. A sample answer follows. The resource-based view suggests that the value of resources depends on several factors, including rarity and inimitability. Both companies have a rare product in the software and blood glucose monitoring process, but the software is more likely to eventually be imitated. While Downside Up is the sole producer for now, with enough money competitors are likely to copy and begin producing their own improved widgets and enter the market as competitors. HC Solutions has a patent on its process and is likely to be the sole provider for years to come. The people comprising the group of engineers at Downside Up have more of a history working together, and the company itself has been in business longer than HC Solutions and enjoys a good reputation as an industry leader. HC Solutions does not have the history of Downside Up, and unless it can replicate the cohesiveness of the blood glucose team, it may have continued conflict in their other teams. Downside Up, as well as the group of engineers, has the advantage of years of numerous small decisions that have led to its position of industry leader today. HC Solutions lacks this advantage but has the opportunity to build this advantage if it can better manage its employees. Both companies have socially complex resources such as culture, atmosphere, status, and reputation, but Downside Up seems to have more of each of these facets than does HC Solutions. While HC Solutions has the opportunity to have highly valued resources, it is not quite at the level the Downside Up currently enjoys. However, if HC Solutions can manage the employees in their teams, it has a better opportunity of creating long-term revenues with its patented product.
