SHORT ANSWER

1. What is real GDP? Why do we calculate real GDP? What are the shortcomings of real GDP?

ANS:

Real GDP is the value of all goods and services produced within an economy's borders over a period of time, at constant prices. It is calculated to measure overall economic activity and aggregate income. This is used as a measure of welfare, as higher income connotes higher consumption, health, leisure, and so on. However, there are shortcomings. First, it misses unreported output (i.e., "under the table" output of goods and services), output that is done in day-to-day life (e.g., making yourself a sandwich), and it assumes that more output leads to more welfare. However, "defensive" output (e.g., walls built to buffer noise pollution) increases GDP but may not improve welfare. Also it does not account for other costs of production (e.g., pollution, crime, resource depletion, etc.).

DIF: Moderate REF: 2.2 TOP: II. MSC: Analyzing

2. Using the expenditure approach to national income accounting, when discussing government expenditures, do we include transfer payments? Why or why not?

ANS:

No. The expenditure approach concentrates on *purchases of goods and services* only. Transfer payments are income transfers and are not directly used to buy things. Therefore, they do not directly stimulate the creation of new value in the economy in the way that purchases of goods and services do. They are a form of negative tax and would therefore be a form of income for recipients of the transfer, enhancing disposable income: disposable income = income - (taxes - transfers).

DIF: Moderate REF: 2.2 TOP: II.B. MSC: Analyzing

3. What are the components that make up the *income approach* to calculating GDP? What are the components that make up the *expenditure approach* to calculating GDP?

ANS:

- (a) Income approach: compensation to employees; indirect business taxes; net operating surplus of business (profits); and depreciation of fixed capital
- (b) Expenditure approach: household consumption; fixed private investment; net exports; and government expenditures

DIF: Easy REF: 2.2 TOP: II.B. | II.C. MSC: Remembering

- 4. Identify which of the following goods are part of the current year's U.S. GDP and which are considered the current year's U.S. gross national product (GNP); explain. (Note: Ford is a company owned by U.S. citizens and Toyota is a company owned by Japanese citizens.)
 - (a) a Ford produced in Mexico
 - (b) a Toyota produced in California
 - (c) a meal you make for a dinner party
 - (d) an American-made vintage T-shirt from Led Zeppelin's 1971 North American tour you bought online last week

ANS:

- (a) It is part of U.S. GNP but not GDP as it is not produced within U.S. borders; it is part of Mexico's GDP.
- (b) It is part of U.S. GDP but not GNP as it is not produced by a U.S. firm; it is part of Japan's GNP.
- (c) Neither; it is "under the table" production and is not included in the national accounts.
- (d) Neither, as it is not current production. The T-shirt is not counted in current GDP; it was, however, part of 1971's GDP.

DIF: Moderate REF: 2.2 TOP: II.E. MSC: Analyzing

5. Consider the data in the following table, which represents the total production of the country Byzantium. It produces only consumer goods.

	2017	2018	2019
Quantity of Y	100	105	103
Quantity of X	5	3	4
Price of Y	\$5	\$5	\$5
Price of X	\$100	\$105	\$110

- (a) Calculate real GDP for all three years, using 2017 as the base year.
- (b) Calculate the consumer price index (CPI), using 2017 as the base year. Identify whether there was inflation from the previous year.

ANS:

Real GDP is a form of the Paasche index, so for each year we use the current year's prices and that year's quantities:

*2017: RGDP =
$$100 \times \$5 + 5 \times \$100 = \$1,000$$

*2018: RGDP =
$$105 \times \$5 + 3 \times \$100 = \$825$$

*2109: RGDP =
$$103 \times \$5 + 4 \times \$100 = \$915$$

The equation for the CPI is:

The equation for the CPT is:
$$GDPDeflator = \frac{P_x^C \cdot Q_x^C + P_y^C \cdot Q_y^C}{P_x^B \cdot Q_x^C + P_y^B \cdot Q_y^C} \times 100,$$

where the C/B superscript denotes the current/base year.

To make it easier, the denominator is equal to \$1,000.

*2017: Since the base and current year are the same: $CPI_{2017} = 100$;

*2018: $825/1000 \times 100 = 82.5$; prices fell 17.5 percent from 2017 to 2018; and

*2019: $915/1000 \times 100 = 91.5$; prices are 8.5 percent lower in 2019 than in 2017 but are about 11 percent higher than in 2018.

6. You are a staff economist for your local bank and the bank manager claims that in 2014 the Chinese economy was bigger than that of the United States. To prove him wrong you decide to put your economics training to work for you and decide to show him China's GDP in U.S. dollars; to show him how smart you are, you also decide to calculate the real GDP of China in U.S. dollars and prices and compare that to the United States as well. You have the following data: in 2014, China's nominal GDP was CY 63.6 trillion (CY = Chinese yuan); the yuan-dollar exchange rate was CY 6.14/\$1; nominal GDP in the United States was \$17.3 trillion; the price level in the United States was 1.0 and the price level in China was 0.6. How big is China's economy?

ANS:

The first part of the question is straightforward. Just convert Chinese nominal GDP to dollars by dividing it by the yuan-dollar exchange rate (conversely, this is the same as multiplying it by the dollar-yuan exchange rate): $\$NGDP_{CH} = 63.6/6.14 = \10.4 . Thus, the Chinese economy is about 60 percent the size of the U.S. economy. But to get a more accurate view we need to look at GDP adjusted for price differences, PPP adjusted Chinese GDP. So we use the equation:

$$PPPGDP_{CH} = P_{US}/P_{CH} \times \$NGDP_{CH} = (1/0.6) \times \$10.4 \text{ tril} = \$17.3 \text{ tril}.$$

Thus, once we take price differences into consideration, the Chinese economy is about the same size as the U.S. economy.

9. There has been a lot of discussion about the European economies that use the euro as their currency. You discuss this with your aunt and uncle in Denmark. They hear that the eurozone (EZ) economies are shrinking, but when they look at the data, presented below, they actually see that EZ nominal GDP (NGDP) is growing. They know you are taking economics and ask you how these both can be true. You decide to collect some additional data to answer the question: you collect the exchange rate, the relative prices in the EZ and the United States, and the CPI for the EZ economies, and you fill in the rest of the table, which is PPP GDP in U.S. dollars, PPP GDP in euros (€), and real GDP in U.S. dollars. Is there a contradiction between what your Danish family heard and the data? How can you explain what appears to be the contradiction?

Table 2.7: U.S. and Eurozone (18 Economies) Nominal GDP in 2014

	Eurozone NGDP	\$US/Euro Exchange			GDP PPP	NGDP	GDP PPP
Year	(billions)	Rate	$P_{\text{EZ}}\!/P_{\text{US}}$	CPI	(€s)	(\$US)	(\$US)
2010	9,535	1.33	0.79	0.933	_	_	_
2011	9,794	1.39	0.78	0.958	_	_	_
2012	9,835	1.29	0.78	0.982	_	_	_

2014	10,113	1.33	0.76	1.000	_	_	_
2015	10,403	1.11	0.77	1.000	_	-	_

(Source: FRED II, Eurostat)

ANS:

Looking at the data in the first column, indeed the 18 EZ economies are growing. But once you do some calculations adjusting for prices, different currencies, and both, a different picture arises. First, we can see that PPP GDP in euros has stayed more or less constant at about €7.6 trillion. This is because, although the EZ economies have been growing, it has been slow, about 1.5 percent. Secondly, we see that, relative to the dollar, the euro buys fewer goods and services. Similarly, for real GDP, inflation was relatively high from 2010–2013, and then calmed down, eroding income. With respect to nominal GDP in U.S. dollars, we see that in 2015 it fell and is roughly €1 trillion less than it was in 2010; this is largely due to the sharp decline in the value of the euro relative to the U.S. dollar in 2015. All these combine to reduce PPP adjusted GDP over the period.

Table 2.7: U.S. and Eurozone (18 Economies) Nominal GDP in 2014

	Eurozone	\$US/Euro			GDP			GDP
	NGDP	Exchange			PPP	RGDP	NGDP	PPP
