DIF: Medium REF: 1.2 TOP: II.C.ii MSC: Understanding

7. Describe the effects of three microbial diseases that have significantly affected human populations throughout history.

ANS:

Answers may vary. Some examples include bubonic plague, which killed one-third of Europe's population in the fourteenth century; tuberculosis, which was common in the nineteenth century; AIDS, which affects many people today; and smallpox, which killed a large number of native North Americans.

DIF: Medium REF: 1.2 TOP: II.A.i | II.A.ii

MSC: Applying

8. Why did it take so long for humans to determine that microbes cause infectious diseases?

#### ANS:

Microbes are too small to be seen with the naked eye, so until microscopes were invented, humans did not know that microbes existed. Even after humans were aware of the presence of microbes, they did not suspect them of causing disease until people such as Joseph Lister and Ignaz Semmelweis performed experiments that showed antiseptics decrease the incidence of infection.

DIF: Difficult REF: 1.2 | 1.3 TOP: II.B.i | III.C.iii

MSC: Understanding

9. Robert Koch's postulates have not been used to prove HIV as the causative agent of AIDS. Why not?

# ANS:

Answers may vary, but a major reason is that humans cannot be injected with HIV to see if they develop AIDS!

DIF: Difficult REF: 1.3 TOP: III.B.ii MSC: Understanding

10. Define attenuation and describe some mechanisms used to attenuate pathogens.

#### ANS:

Attenuation results in a weakened organism that will not produce full-blown disease, but will generate immunity. Answers for mechanisms may vary. See discussion in textbook, Section 1.3, entitled "Immunization Prevents Disease."

DIF: Medium REF: 1.3 TOP: III.C.i | III.C.ii

MSC: Understanding

11. What is the significance of the work of Ignaz Semmelweis and Joseph Lister?

#### ANS:

They showed that use of antiseptics on doctors' hands and medical instruments drastically reduced the mortality rate of hospital patients. They made these observations before Robert Koch's germ theory of disease.

DIF: Medium REF: 1.3 TOP: III.C.iii MSC: Understanding

12. How would you use Robert Koch's postulates to prove that a specific organism causes a new disease in mice?

#### ANS:

See Figure 1.18 in the textbook.

- (1) The suspected organism is found in all diseased mice, but is absent from healthy mice.
- (2) The suspected organism is isolated from the diseased mice and grown in pure culture.
- (3) When the suspected organism is introduced into a healthy mouse, the same disease occurs.

(4) The same strain of microbe is obtained from the newly diseased mouse.

DIF: Medium REF: 1.3 TOP: III.B.ii MSC: Applying

13. Explain why the organisms that were studied by Sergei Winogradsky could not be grown on Robert Koch's plate media containing agar or gelatin.

## ANS:

The organisms studied by Winogradsky were lithotrophs, which feed solely on inorganic substances. Koch's plate media contained organic nutrient sources.

DIF: Difficult REF: 1.4 TOP: IV.A.ii MSC: Understanding

14. Is it true that only culturable bacteria contribute to ecology? Explain your answer.

## ANS:

No, this is not a true statement. It is estimated that barely 0.1% of microbial species can be cultured. The work of Winogradsky and later microbial ecologists showed that bacteria are necessary for geochemical cycling. Many of these organisms can't be grown in pure culture on laboratory media, but can be grown in enrichment culture such as a Winogradsky column.

DIF: Difficult REF: 1.4 TOP: IV.B MSC: Understanding

15. Define the term "endosymbiont" and give an example of an endosymbiotic relationship found in nature.

## ANS:

An endosymbiont is an organism living symbiotically inside a larger organism. Examples may vary, but include the following: *Rhizobium* in a leguminous plant; bioluminescent bacteria in the light organs of fish and squid; photosynthetic algae and coral.

DIF: Medium REF: 1.4 TOP: IV.B MSC: Applying

16. Give two reasons why microbes have been difficult to classify.

# ANS:

First, even with the use of light microscopes, only the basic shape of microbes can be determined, and many microbes have similar shapes even though they are very different in other ways. Second, microbes do not fit the classic definition of a species, which is a group of organisms that interbreed. Microbes typically reproduce asexually. When they do exchange genes, they may do so with distantly related species.

DIF: Medium REF: 1.5 TOP: V.A.i | V.A.ii

MSC: Understanding

17. Briefly explain the endosymbiosis theory and the evidence that supports it.

# ANS:

The endosymbiosis theory proposes that mitochondria and chloroplasts evolved from bacteria that were engulfed by pre-eukaryotic cells, and that over time these endosymbiotic prokaryotic cells lost the ability to survive outside of the host cell but were maintained as organelles. Evidence supporting the endosymbiosis theory includes the fact that mitochondria and chloroplasts possess circular DNA with similarity to modern bacteria.

DIF: Difficult REF: 1.5 TOP: V.C MSC: Understanding

18. What were the contributions of Rosalind Franklin toward discovering the structure of DNA and why wasn't she one of the recipients of the Nobel Prize for this discovery?

## ANS:

She was an X-ray crystallographer who studied the structure of DNA. Her X-ray micrographs showed for the first time that DNA was a double helix. A colleague showed her micrographs to James Watson, who was also studying the structure of DNA. Watson and Francis Crick published their model of the structure of DNA in the journal *Nature* and denied that they had used Franklin's micrographs.

DIF: Medium REF: 1.6 TOP: VI.C.i MSC: Remembering

19. Briefly describe how the ultracentrifuge is used to determine the sizes of cellular macromolecules.

# ANS:

The ultracentrifuge uses centrifugal forces to separate cell components. Theodor Svedberg calculated that the particle sizes could be determined based on the rate of sedimentation of the particles in an ultracentrifuge.

DIF: Medium REF: 1.6 TOP: VI.B.ii MSC: Understanding

20. If you want to produce DNA polymerases like those used in polymerase chain reaction (PCR) for amplification of DNA, from which natural environment would you try to isolate the producers?

## ANS:

Taq DNA polymerase used in PCR amplification of DNA was extracted from *Thermus aquaticus*, a bacterium found in a hot spring in Yellowstone National Park. Since DNA polymerase has to survive many rounds of cycling to near-boiling temperatures, the most conducive environment for finding DNA polymerase, such as the enzymes used in PCR reactions, would be searching for microbes in an environment where the temperature is extremely high.

DIF: Difficult REF: 1.6 TOP: VI.C.ii MSC: Applying
